

• Devijver and Kittler (1982):

"Extracting from the raw data the information which is most relevant for classification purposes, in the sense of minimizing the within-class pattern variability while enhancing the between-class variability".

- Within-class pattern variability: variance between objects belonging to the same class.
- Between-class pattern variability: variance between objects from different classes.

ABCDEFGHIJ

- We will discriminate between different object classes based on a set of features.
- The features are chosen given the application.
- Normally, a large set of different features is investigated.
- Classifier design also involves feature selection
   selecting the best subset out of a larger feature set.
- Given a training data set of a certain size, the dimensionality of the feature vector must be limited.
- Careful selection of an optimal set of features is the most important step in image classification!

Describing the shape of a segmented object

Assumptions:

- We have a segmented, labeled image.
- Each object that is to be described has been identified during segmentation.

- Ideally, one region in the segmented image should correspond to one object.
- One object should not be fragmented into several non-connected regions.
- Some small noise objects will often occurr, but these can often be removed later. (next lecture on mathematical morphology)

# F06 09.10.2013 INF 4300 5 F06 09.10.2013 INF 4300 6

### Example 2: Recognize music symbols

• Goal:interpret the notes and symbols to create a MIDI-file and then play it!

Steps in the program:

- 1. Segment the image to find symbol pixels.
- 2. Find angle of rotation and rotate back.
- 3. Find the note lines and remove them.
- 4. Create regions objects for connected components.
- Match each object with a known object class (whole note, quarter note, rest, bar, etc.) based on object features.
- 6. For all notes: find note height given its vertical position.
- 7. Create a MIDI file from this.

### Example 1: Recognize printed numbers

 Goal: get the series of digits, e.g. 14159265358979323846.....

#### Steps in the program:

- 1. Segment the image to find digit pixels.
- 2. Find angle of rotation and rotate back.
- 3. Create region objects one object pr. digit or connected component.
- 4. Compute features describing shape of objects
- 5. Train a classifier on many objects of each digit.

### 6. Assign a class label to each new object, i.e., the class with the highest probability.

## From pixels to features

• Input to the classifier is normally a set of features derived from the image data, not the image data itself.

- Why can't we just use all the gray level pixels as they are for text recognition?
  - Objects correspond to regions. We need the spatial relationship between the pixels.
  - For textured regions, we need at least 2. order.
  - For text recognition: the information is in the shape, not in the gray levels.

-Moment of inertia

#### F06 09.10.2013

### **1D Projections**

• For each row in the region, count the number of object pixels.

### Projections

• 1D horizontal projection of the region:

$$p_h(x) = \sum_y f(x, y)$$

• 1D vertical projection of the region:

$$p_{v}(y) = \sum f(x, y)$$

- Can be made scale independent by using a fixed number of bins and normalizing the histograms.
- Radial projection in reference to centroid -> "signature".

#### Use of projection histograms Use of projection histograms Check if a page with text is rotated Divide the object into different 14159265358979323 regions and compute projection 41971693993751058 06286208998628034 histograms for each region. 08651328230664709. 53594081284811174 - How can we use this 05559644622948954 665933446128475648 to separate 6 and 9? 190914564856692346 • Compute features from the histograms. Detecting lines, connected objects or single symbols • The histograms can also be used as features directly. 13 INF 4300 F06 09.10.2013 **INF 4300** F06 09.10.2013 14 Object area Geometric features from contours • Generally, the area is defined as: $A = \prod I(x, y) dx dy$ Boundary length/perimeter Area I(x,y) = 1 if the pixel is within the object, and 0 otherwise. Curvature $A = \sum_{y} \sum_{y} I(x, y) \Delta A$ • In digital images: Diameter/major/minor axis Eccentricity $\Delta A$ = area of one pixel. If $\Delta A$ = 1, area is simply measured in pixels. • Bending energy Basis expansion (Fourier – last week) • Area changes if we change the scale of the image change is not perfectly linear, because of the discretization of the image. \_ Area ≈ invariant to rotation (except small discretization errors). 15 F06 09.10.2013 INF 4300 F06 09.10.2013 INF 4300 16

### Perimeter length from chain code

- Distance measure differs when using 8- or 4-neighborhood
- Using 4-neighborhood, measured length  $\geq$  actual length.
- In 8-neighborhood, fair approximation from chain code by:

 $P_F = n_E + n_O \sqrt{2}$ 

- This overestimates real perimeters systematically.
- Freeman (1970) computed the area and perimeter of the chain by

 $A_{F} = \sum_{i=1}^{N} c_{ix} \left( y_{i-1} + \frac{c_{iy}}{2} \right), \quad P_{F} = n_{E} + n_{O}\sqrt{2}$ 

- where **N** is the length of the chain,  $\mathbf{c}_{i\mathbf{x}}$  and  $\mathbf{c}_{i\mathbf{y}}$  are the **x** and **y** components of the **i**th chain element  $\mathbf{c}_i (\mathbf{c}_{i\mathbf{x}}, \mathbf{c}_{i\mathbf{y}} = \{1, 0, -1\}$  indicate the change of the **x**- and **y**-coordinates),  $\mathbf{y}_{i-1}$  is the **y**-coordinate of the start point of the chain element  $\mathbf{c}_i \cdot \mathbf{n}_E$  is the number of even chain elements and  $\mathbf{n}_0$  the number of odd chain elements.

### F06 09.10.2013

## Chain code

 Vossepoel and Smeulders (1982) improved perimeter length estimate by a corner count n<sub>c</sub>, defined as the number of occurrences of unequal consecutive chain elements:

$$P_{VS} = 0.980 n_E + 1.406 n_O - 0.091 n_O$$

• Kulpa (1977) gave the perimeter as

$$P_{K} = \frac{\pi}{8} \left( 1 + \sqrt{2} \right) \left( n_{E} + \sqrt{2} n_{O} \right)$$

F06 09.10.2013

INF 4300

## Pattern matching - bit quads

- Let n{Q} = number of matches between image pixels and pattern Q.
- Then area and perimeter of 4-connected object is given by:  $A = n\{1\}, P = 2n\{0 \ 1\} + 2n \begin{cases} 0\\ 1 \end{cases}$

$$-n(1), 1-2n$$

Bit Quads handle 8-connected images:

- Gray (1971) gave area and the perimeter as  $A_{c} = \frac{1}{4} [n\{Q_{1}\} + 2n\{Q_{2}\} + 3n\{Q_{3}\} + 4n\{Q_{4}\} + 2n\{Q_{5}\}], P_{c} = n\{Q_{1}\} + n\{Q_{2}\} + n\{Q_{3}\} + 2n\{Q_{5}\}$
- More accurate formulas by Duda :
- $A_{D} = \frac{1}{4} \left[ n \{Q_{1}\} + 2n \{Q_{2}\} + \frac{7}{2} n \{Q_{3}\} + 4n \{Q_{4}\} + 3n \{Q_{D}\} \right], \quad P_{D} = n \{Q_{2}\} + \frac{1}{\sqrt{2}} \left[ n \{Q_{2}\} + n \{Q_{3}\} + 2n \{Q_{D}\} \right]$

F06 09.10.2013

## A comparison of methods

- We have tested the methods on circles, R ={5,...,70}.
- Area estimator :
   Duda is slightly better than Gray.
- Perimeter estimator :
   Kulpa is more accurate than Freeman.
- Circularity :
   Kulpa's perimeter and Gray's area gave the best result.
- Errors and variability largest when R is small.
- Best area and perimeter not computed simultaneously.
- Gray's area can be computed using discrete Green's theorem, suggesting that the two estimators can be computed simultaneously during contour following.

F06 09.10.2013

## Object area from contour

• The surface integral over S (having contour C) is given by Green's theorem:

The region can also be represented by n polygon vertices

where the sign of the sum reflects the polygon orientation.

$$\hat{A} = \frac{1}{2} \sum_{k=0}^{N-1} (x_k y_{k+1} - x_{k+1} y_k)$$

 $A = \iint\limits_{S} dx dy = \int\limits_{C} x dy$ 

F06 09.10.2013

INF 4300

 $\mathbf{1}$   $\mathbf{N}$   $\mathbf{1}$ 

## Compactness and circularity

- Compactness (very simple measure)
  - $\gamma = P^2 / (4\pi A)$ , where P = Perimeter, A = Area,
  - For a circular disc,  $\boldsymbol{\gamma}$  is minimum and equals 1.
  - Compactness attains high value for complex object shapes, but also for very elongated simple objects, like rectangles and ellipses where a/b ratio is high.
  - => Compactness is not correlated with complexity!
- G&W defines
  - Compactness = P<sup>2</sup>/A
  - Circularity ratio = 4nA/P<sup>2</sup>

```
F06 09.10.2013
```

INF 4300

22

## Circularity and irregularity

- Circularity may be defined by  $C = 4\pi A/P^2$ .
- C = 1 for a perfect continuous circle; betw. 0 and 1 for other shapes.
- In digital domain, C takes its smallest value for a
  - digital octagon in 8-connectivity perimeter calculation
  - digital diamond in 4-connectivity perimeter calculation
- Dispersion may be given as the major chord length to area
- Irregularity can be defined as:

$$D = \frac{\pi \max((x_i - \overline{x})^2 - (y_i - \overline{y})^2)}{A}$$

- where the numerator is the area of the centered enclosing circle.
- Alternatively, ratio of maximum and minimum centered circles:

$$I = \frac{\max(\sqrt{(x_i - \bar{x})^2 - (y_i - \bar{y})^2})}{\min(\sqrt{(x_i - \bar{x})^2 - (y_i - \bar{y})^2})}$$

#### 23

21

### Curvature

- In the continous case, curvature is the rate of change of slope.

$$|\kappa(s)|^2 = \left[\frac{d^2x}{ds^2}\right]^2 + \left[\frac{d^2y}{ds^2}\right]^2$$

- In the discrete case, difficult because boundary is locally ragged.
- Use difference between slopes of adjacent boundary segments to describe curvature at point of segment intersection.
- Curvature can be calculated from chain code.

## Moments from binary images

- For binary images, where  $f(x, y) = 1 \Rightarrow$  object pixel  $f(x, y) = 0 \Rightarrow$  background pixel
- Area

$$m_{00} = \sum_{x} \sum_{y} f(x, y)$$

• Center of mass /"tyngdepunkt"

$$m_{10} = \sum_{x} \sum_{y} x f(x, y) = \bar{x} m_{00} \quad \Rightarrow \quad \bar{x} = \frac{m_{10}}{m_{00}}$$

 $m_{01}$  $m_{00}$ 

29

31

$$m_{01} = \sum_{x} \sum_{y} yf(x, y) = \bar{y}m_{00} \quad \Rightarrow \quad \bar{y} =$$
F06 09.10.2013 INF 4300

## Grayscale moments

- In gray scale images, we may regard f(x,y)as a discrete 2-D probability distribution over (x,y)
- · For probability distributions, we should have

$$m_{00} = \sum_{x} \sum_{y} f(x, y) = 1$$

And if this is not the case we can normalize by

$$F(x,y) = f(x,y)/m_{00}$$

F06 09.10.2013

INF 4300

## Central moments

• These are position invariant moments, defined by

• where 
$$\begin{aligned} \mu_{p,q} &= \sum_{x} \sum_{y} (x-\bar{x})^p (y-\bar{y})^q f(x,y) \\ \bar{x} &= \frac{m_{10}}{m_{00}}, \quad \bar{y} = \frac{m_{01}}{m_{00}} \end{aligned}$$

• The total mass, and the center of mass coordinates are given by

$$\mu_{00} = \sum_{x} \sum_{y} f(x, y), \quad \mu_{10} = \mu_{01} = 0$$

This corresponds to computing ordinary moments after having translated the object so that center of mass is in origo. ٠

INF 4300

- Central moments are independent of position, • but are not scaling or rotation invariant.
- Q: What is  $\mu_{00}$  for a binary object?

F06 09.10.2013

## Central moments from m<sub>pg</sub>

• Moments  $\mu_{pq}$  (p + q  $\leq$  3) are given by  $m_{pq}$  by:  $\mu_{00} = m_{00}, \ \mu_{10} = 0, \ \mu_{01} = 0$  $\mu_{20} = m_{20} - \overline{x}m_{10}$  $\mu_{02} = m_{02} - \overline{y}m_{01}$  The 3D µ<sub>par</sub>, are expressed by m<sub>par</sub>:  $\mu_{11} = m_{11} - \overline{y}m_{10}$  $\mu_{20} = m_{20} - 3\overline{x}m_{20} + 2\overline{x}^2m$  $\mu_{nar} = \sum_{r}^{P} \sum_{r}^{q} \sum_{r}^{r} - 1^{[D-d]}$  $\Delta x^{p-s} \Delta y^{q-t}$  $\mu_{12} = m_{12} - 2 \overline{\nu} m_{11} - \overline{x} m$  $\mu_{21} = m_{21} - 2\overline{x}m_{11} - \overline{y}m_{20} + 2\overline{x}^2m_{00}$  where  $\mu_{03} = m_{03} - 3\overline{x}m_{02} + 2\overline{y}^2m_0$ • D = (p + q + r); d = (s + t + u) and the binomial coefficients are given by w < vw!(v - w)!INF 4300

• The two second order central moments measure the spread of points around the y- and x-axis through the centre of mass

 $\mu_{20} = \sum_{x} \sum_{y} (x - \bar{x})^2 f(x, y)$  $\mu_{02} = \sum_{x} \sum_{y} (y - \bar{y})^2 f(x, y)$ 

- From physics: moment of inertia about an axis: how much energy is required to rotate the object about this axis:
   Statisticans like to call this variance.
- The cross moment of intertia is given by

$$\mu_{11} = \sum_{x} \sum_{y} (x - \bar{x})(y - \bar{y}) f(x, y)$$

- Statisticians call this covariance or correlation
- Orientation of the object can be derived from these moments.
   This implies that they are not invariant to rotation.

F06 09.10.2013

INF 4300

### Moments of inertia for simple shapes

- Rectangular object (2a×2b):  $I_{20} = 4a^{3}b/3$ ,  $I_{02} = 4ab^{3}/3$
- Square (a×a): I<sub>20</sub> = I<sub>02</sub> = a<sup>4</sup>/12

F06 09.10.2013

• Elliptical object, semi-axes (a,b):  $I_{20} = \pi a^{3}b/4$ ,  $I_{02} = \pi ab^{3}/4$ 

2a

• Circular object, radius R:  $I_{20} = I_{02} = \pi R^4/4$ 

INF 4300

#### 35

33

2b

## Moments of an ellipse

• Assume that the ellipse has semimajor and semiminor axes (*a,b*), a>b. An ellipse where major axis is along x-axis is given by

$$(x/a)^{2} + (y/b)^{2} = 1 \implies y = \pm \frac{b}{a}\sqrt{a^{2} - x^{2}}$$

#### The largest second order central moment (here called $I_{20}$ ) is given by

## Object orientation - I

- Orientation is defined as the angle, relative to the X-axis, of an axis through the centre of mass that gives the lowest moment of inertia.
- Orientation θ relative to X-axis found by minimizing:

$$I(\theta) = \sum_{\alpha} \sum_{\beta} \beta^2 f(\alpha, \beta)$$

where the rotated coordinates are given by

 $\alpha = x \cos \theta + y \sin \theta$ ,  $\beta = -x \sin \theta + y \cos \theta$ 

• The second order central moment of the object around the a-axis, expressed in terms of x, y, and the orientation angle  $\theta$  of the object is:

$$I(\theta) = \sum_{x} \sum_{y} [y \cos \theta - x \sin \theta]^2 f(x, y)$$

- We take the derivative of this expression with respect to the angle  $\boldsymbol{\theta}$
- Set derivative equal to zero, and find a simple expression for  $\theta$  :

INF 4300

## Object orientation - II

• Second order central moment around the a-axis:

 $I(\theta) = \sum \sum [y \cos \theta - x \sin \theta]^2 f(x, y)$ 

• Derivative w.r.t.  $\Theta = 0 =>$ 

• So the object orientation is given by:

 $\frac{2\mu_{11}}{(\mu_{11} - \mu_{12})}$  $\theta = \frac{1}{2} \tan^{-1}$ 

where 
$$\theta \in [0, \pi/2]$$
 if  $\mu_{11} > 0, \ \theta \in [\pi/2, \pi]$  if  $\mu_{11} < 0$ 

F06 09.10.2013

```
INF 4300
```

## The best fitting ellipse

- Object ellipse is defined as the ellipse whose least and greatest moments of inertia equal those of the object.
- Semi-major and semi-minor axes are given by

$$,\hat{b} = \sqrt{\frac{2\left[\mu_{20} + \mu_{02} \pm \sqrt{\left(\mu_{20} + \mu_{02}\right)^2 + 4\mu_{11}^2}\right]}{\mu_{02}}}$$

• Numerical eccentricity is given by

- Orientation invariant object features.
- Gray scale or binary object.

39

37

#### F06 09.10.2013

INF 4300

Bounding box - again

• Image-oriented bounding box:

- Found by searching for min and max x and y within the object (*xmin, ymin, xmax, ymax*)
- Object-oriented bounding box:
  - Smalles rectangle around the object, having one side parallell to the orientation of the object ( $\theta$ ).
  - The transformation

### $\alpha = x\cos\theta + y\sin\theta, \quad \beta = y\cos\theta - x\sin\theta$

is applied to all pixels in the object (or its boundary).

– Then search for  $\alpha_{min}$ ,  $\beta_{min}$ ,  $\alpha_{max}$ ,  $\beta_{max}$ 

```
F06 09.10.2013
```

INF 4300

## Radius of gyration, K

• The radius of a circle where we could concentrate all the mass of an object without altering the moment of inertia about its center of mass.

$$I = \mu_{00} \hat{K}^2 \implies \hat{K} = \sqrt{\frac{I_z}{\mu_{00}}} = \sqrt{\frac{I_x + I_y}{\mu_{00}}} = \sqrt{\frac{\mu_{20} + \mu_{02}}{\mu_{00}}}$$

- This feature is invariant to rotation.
- A very useful quantity because it can be determined, for homogeneous objects, entirely by their geometry.
- Squared radius of gyration, K<sup>2</sup>, may be tabulated for simple object shapes, to help us compute the moments of inertia.

$$\eta_{pq} = \frac{\mu_{pq}}{(\mu_{00})^{\gamma}}, \quad \gamma = \frac{p+q}{2} + 1, \quad p+q \ge 2$$

### Rotation invariant moments

- **1** Find principal axes of object, rotate and compute moments. This can break down if object has no unique principal axes.
- **2** The method of absolute moment invariants:

This is a set of normalized central moment combinations, which can be used for scale, position, and rotation invariant pattern identification.

• For second order (p+q=2), there are two invariants:

 $\phi_1 = \eta_{20} + \eta_{02}$   $\phi_2 = (\eta_{20} - \eta_{02})^2 + 4\eta_{11}^2$ 

## Third order Hu moments

For third order moments, (p+q=3), the invariants are:

$$\begin{split} \phi_{3} &= (\eta_{30} - 3\eta_{12})^{2} + (3\eta_{21} - \eta_{03})^{2} \\ \phi_{4} &= (\eta_{30} + \eta_{12})^{2} + (\eta_{21} + \eta_{03})^{2} \\ \phi_{5} &= (\eta_{30} - 3\eta_{12})(\eta_{30} + \eta_{12})[(\eta_{30} + \eta_{12})^{2} - 3(\eta_{21} + \eta_{03})^{2}] \\ &+ (3\eta_{21} - \eta_{03})(\eta_{21} + \eta_{03})[3(\eta_{30} + \eta_{12})^{2} - (\eta_{21} + \eta_{03})^{2}] \\ \phi_{6} &= (\eta_{20} - \eta_{02})[(\eta_{30} + \eta_{12})^{2} - (\eta_{21} + \eta_{03})^{2}] + 4\eta_{11}(\eta_{30} + \eta_{12})(\eta_{21} + \eta_{03}) \\ \phi_{7} &= (3\eta_{21} - \eta_{03})(\eta_{30} + \eta_{12})[(\eta_{30} + \eta_{12})^{2} - 3(\eta_{21} + \eta_{03})^{2}] \\ &- (\eta_{30} - 3\eta_{12})(\eta_{21} + \eta_{03})[3(\eta_{30} + \eta_{12})^{2} - (\eta_{21} + \eta_{03})^{2}] \\ \phi_{7} &= \text{is skew invariant, and may help distinguish between mirror images.} \end{split}$$

• These moments are not independent, and do not comprise a complete set.

INF 4300 F06 09.10.2013 INF 4300 45 F06 09.10.2013 46

### Hu's moments; a bit simplified

For second order moments (p+q=2), two invariants are used:

 $\varphi_1 = \eta_{20} + \eta_{02}$  $\varphi_2 = (\eta_{20} - \eta_{02})^2 + 4\eta_{11}^2$ 

For third order moments, (p+q=3), we can use  $a = (\eta_{30} - 3\eta_{12}),$  $b = (3\eta_{21} - \eta_{03}),$  $c = (\eta_{30} + \eta_{12})$ , and  $d = (\eta_{21} + \eta_{03})$ and simplify the five last invariants of the set:  $(n - 2^2 \pm b^2)$ 

$$\begin{aligned} \varphi_3 &= a^2 + b^2 \\ \varphi_4 &= c^2 + d^2 \\ \varphi_5 &= ac[c^2 - 3d^2] + bd[3c^2 - d^2] \\ \varphi_6 &= (\eta_{20} - \eta_{02})[c^2 - d^2] + 4\eta_{11}cd \\ \varphi_7 &= bc[c^2 - 3d^2] - ad[3c^2 - d^2] \end{aligned}$$

#### F06 09.10.2013

#### 47

## Hu moments of simple objects

• In the continuous case, the two first Hu moments of a binary rectangular object of size 2a by 2b, are given by

 $\phi_1 = \frac{1}{12} \left( \frac{a}{b} + \frac{b}{a} \right), \qquad \phi_2 = \left( \frac{1}{12} \right)^2 \left( \frac{a}{b} - \frac{b}{a} \right)^2$ 

while the remaining five Hu moments are all zero.

· Similarly, the two first Hu moments of a binary elliptic object with semi-axes a and b, are given by

$$\phi_1 = \frac{1}{4\pi} \left( \frac{a}{b} + \frac{b}{a} \right), \qquad \phi_2 = \left( \frac{1}{4\pi} \right)^2 \left( \frac{a}{b} - \frac{b}{a} \right)^2$$

while the remaining five Hu moments are all zero.

## $\Phi_1$ and $\phi_2$ versus a/b

- Only  $(\phi_1, \phi_2)$  are useful for these simple objects.
- Notice that even in the continuous case it may be hard to distinguish between an ellipse and its bounding rectangle using these two moments.

- Relative difference in  $\phi_2$  of ellipse and its object oriented bounding rectangle is constant, 8.8%.
- Relative differences given above are also true when comparing an ellipse with a same-area rectangle having the same a/b ratio, regardless of the size and eccentricity of the ellipse.

F06 09.10.2013

49

Hu's first moment versus a

INF 4300

## Moments as shape features

- The central moments are seldom used directly as shape descriptors.
- Major and minor axis are useful shape descriptors.
- Object orientation is normally not used directly, but to estimate rotation.
- The set of 7 Hu moments can be used as shape features. (Start with the first four, as the last half are often zero for simple objects).

# general affine transforms

### Contrast invariants

- Abo-Zaid et al. have defined a normalization that cancels both scaling and contrast.
- The normalization is given by

$$\sum \frac{(p+q)}{2}$$

$$\eta_{pq} = \frac{\mu_{pq}}{\mu_{00}} \left( \frac{\mu_{00}}{\mu_{20} + \mu_{02}} \right)$$

- This normalization also reduces the dynamic range of the moment features, so that we may use higher order moments without having to resort to logarithmic representation.
- · Abo-Zaid's normalization cancels the effect of changes in contrast, but not the effect of changes in intensity:

INF 4300

$$f'(x, y) = f(x, y) + b$$

• In practice, we often experience a combination:

$$f'(x, y) = cf(x, y) + b$$

#### Scatter plots • A 2D scatter plot is a plot of MinorAxisLength vs. MajorAxisLength for Symbols 1-6 and outliers (11) feature values for two different Feature 2: MinorAxisLength vs. MajorAxisLength for Symbols 1-6 and outliers (11) 70 najor axis features. Each object's feature length values are plotted in the 60 position given by the features values, and with a class label 50 telling its object class. 40 Matlab: gscatter(feature1, feature2, labelvector) 30 Classification is done based on 10 20 more than two features, but this is difficult to visualize. 10 Feature 1: minor axis length • Features with good class separation show clusters for 10 15 20 25 30 35 each class, but different clusters should ideally be separated. ## Two correlated features

Which numbers are well separated?

## A simulation study design

- H. Schulerud and F.Albregtsen: CMPB, 73, 1061-1073, 2004.
- Monte Carlo study, averaging 100 simulations per setting
- 2 classes, normally distributed, common Covar = I
- 10 to 500 feature candidates
- Only 5 features are different between the classes For these 5, the squared difference of class means =  $\delta^2/\sqrt{5}$ ;  $\delta^2$  = 0, 1, 4 the rest of the continuous distributions are EQUAL!
- Stepwise forward-backward feature selection
- 20 1000 training samples
- 20 1000 test samples

## Learning goals – object description

- Invariant topological features
- Projections and signatures
- Geometric features
  - Area, perimeter and circularity/compactness
  - Bounding boxes
  - Moments, binary and grayscale
    - · Ordinary moments and central moments
  - Moments of objects, object orientation, and best fitting ellipse
  - Scale invariance
- Inspection of feature scatter plots
- "Curse of dimensionality" and feature selection
