# UpSTAIRS with Sequence Diagrams

*Øystein Haugen,  
Ragnhild Kobro Runde, Ketil Stølen*

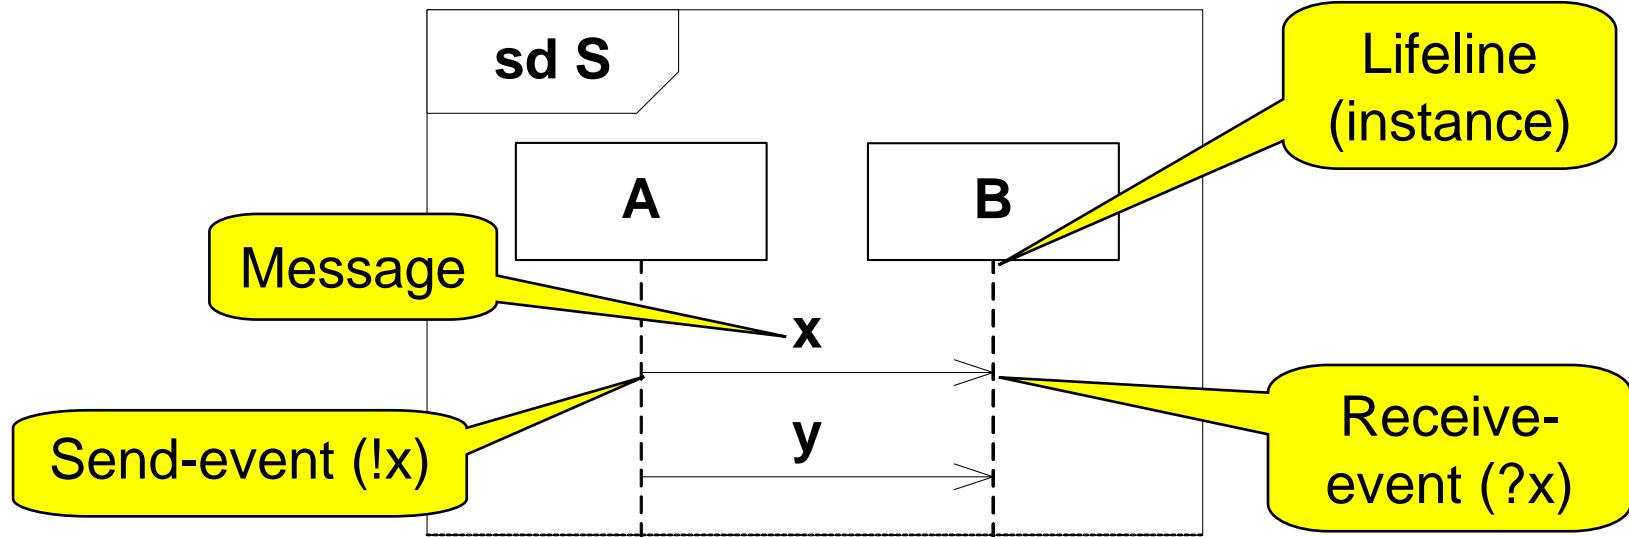

University of Oslo and SINTEF ICT,  
Norway

# Overview

---

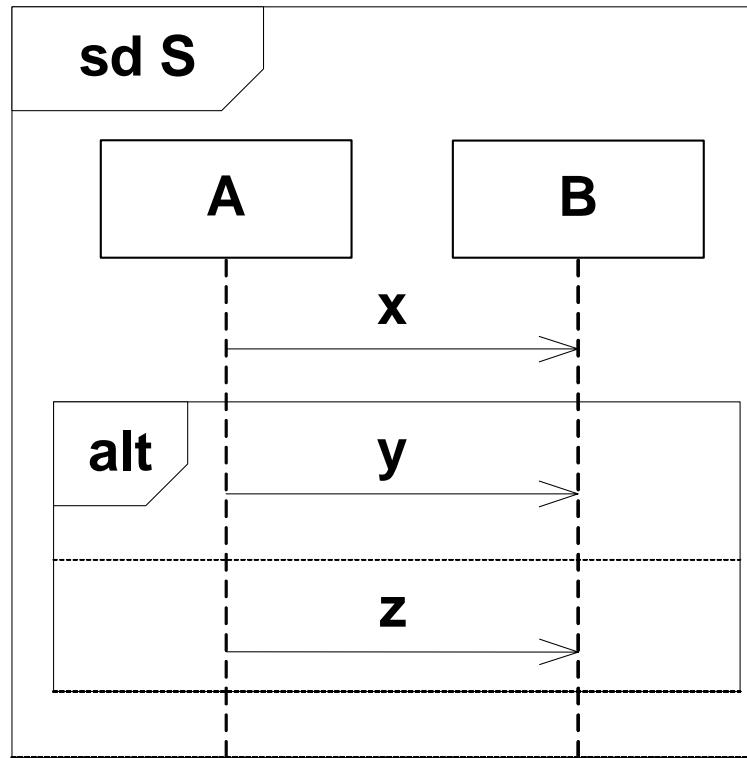

- Interactions and trace semantics
- Interactions as example runs
- Underspecification and nondeterminism
- Refinement

# Background: UML interactions

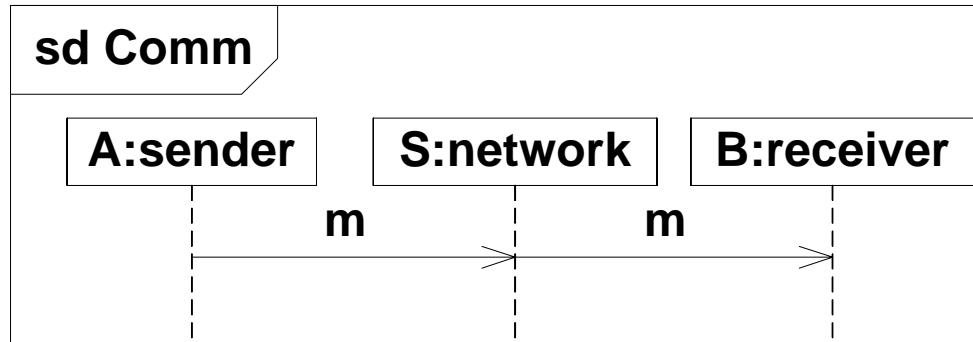

- Partial ordering of events:
  - The send event is ordered before the corresponding receive event.
  - Events on the same lifeline are ordered from the top and downwards.
- S specifies the two traces:
  - $< !x, ?x, !y, ?y >$
  - $< !x, !y, ?x, ?y >$

# Alternatives

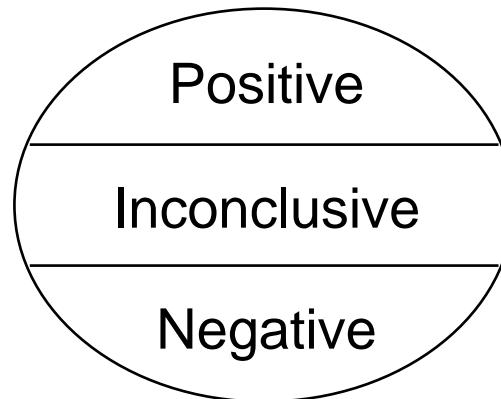

- S specifies the four traces:
    - $< !x, ?x, !y, ?y >$
    - $< !x, !y, ?x, ?y >$
    - $< !x, ?x, !z, ?z >$
    - $< !x, !z, ?x, ?z >$
- First alternative
- Second alternative

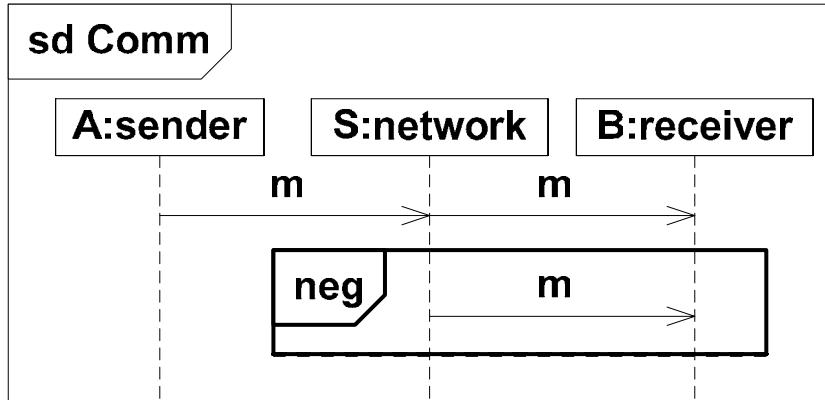

# Example: Network communication

- Interactions = example runs!
  - Specifies a set of positive and/or negative behaviours.

# Negative behaviour

Positive:

$\langle !m_{AS}, ?m_{AS}, !m_{SB}, ?m_{SB} \rangle$

Negative:

$\langle !m_{AS}, ?m_{AS}, !m_{SB}, ?m_{SB}, !m_{SB}, ?m_{SB} \rangle$   
 $\langle !m_{AS}, ?m_{AS}, !m_{SB}, !m_{SB}, ?m_{SB}, ?m_{SB} \rangle$

- Formally:  
 $(p_1, n_1) \geq (p_2, n_2) =$   
 $(p_1 \geq p_2, (p_1 \geq n_2) \cup (n_1 \geq p_2) \cup (n_1 \geq n_2))$
- Note:
  - Inconclusive + positive/negative = inconclusive
  - Positive + negative = negative

# Overview

---

- Interactions and trace semantics
- Interactions as example runs
- Underspecification and nondeterminism 
- Refinement
- Data and guards

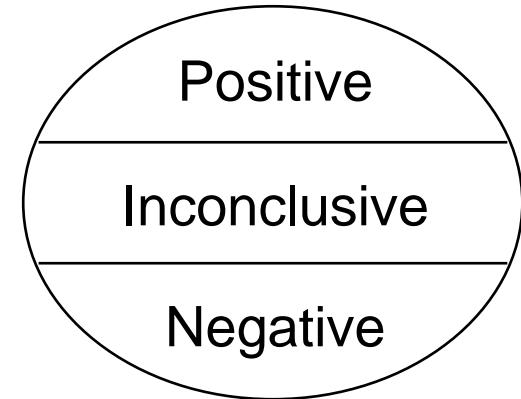

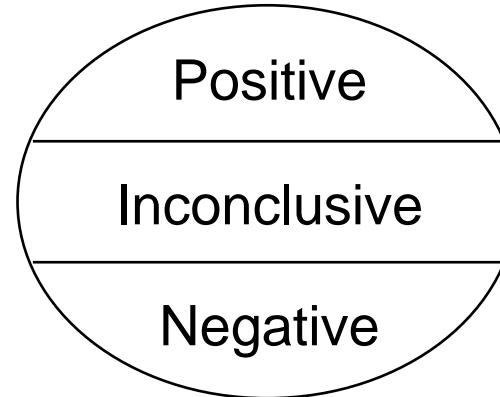

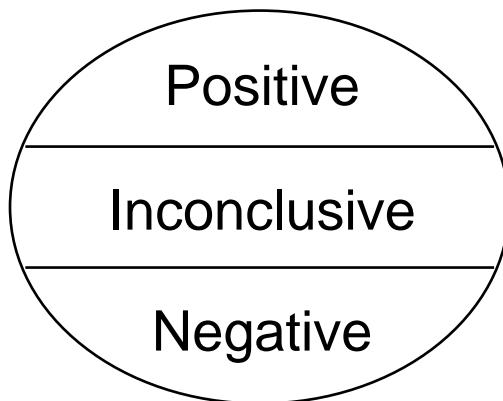

# Underspecification and non-determinism

---

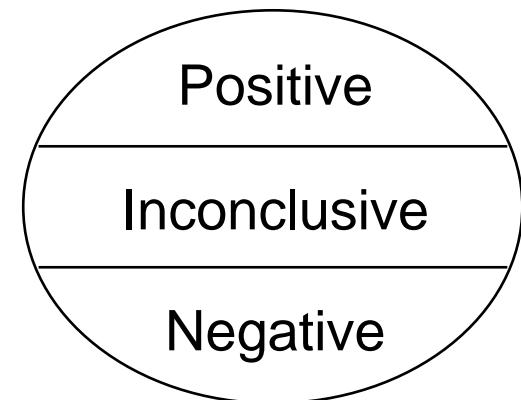

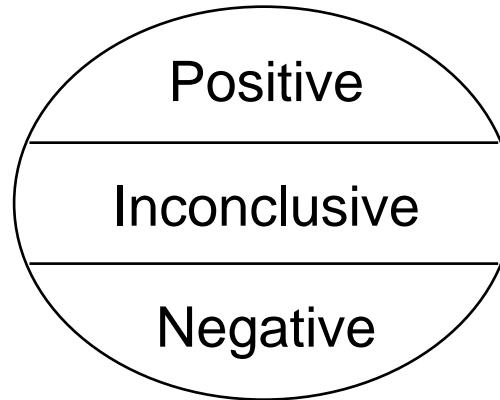

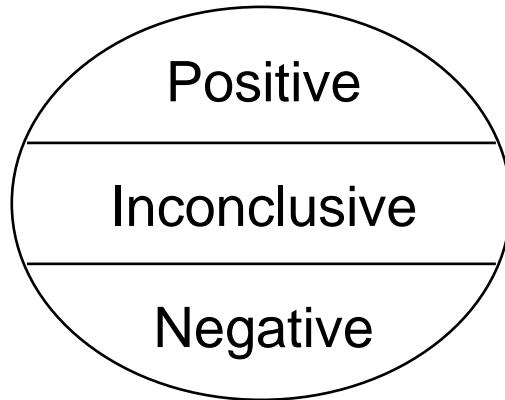

- Underspecification: Several alternative behaviours are considered equivalent (serve the same purpose).
- Inherent non-determinism: Alternative behaviours that must all be possible for the implementation.
- These two should be described differently!

S T A I R S

# STAIRS

xalt

# alt vs xalt

- Assume

$$[[ d1 ]] = (p1, n1)$$

$$[[ d2 ]] = (p2, n2)$$

- alt specifies potential behaviour:

$$[[ d1 \text{ alt } d2 ]]$$

$$= [[ d1 ]] + [[ d2 ]]$$

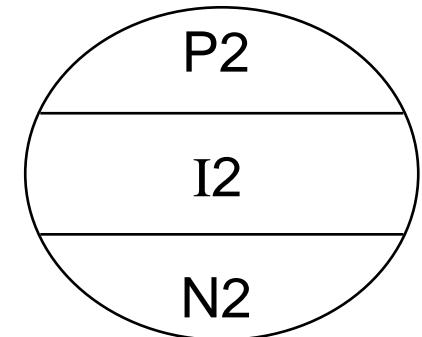

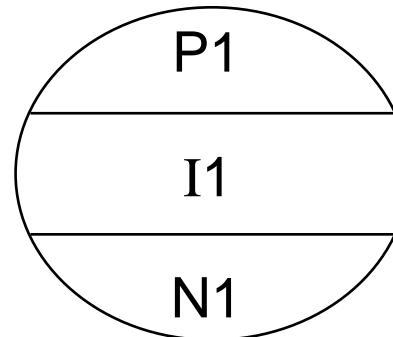

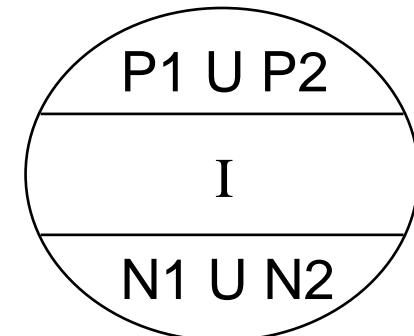

$$= (p1 \cup p2, n1 \cup n2)$$

- xalt specifies mandatory behaviour:

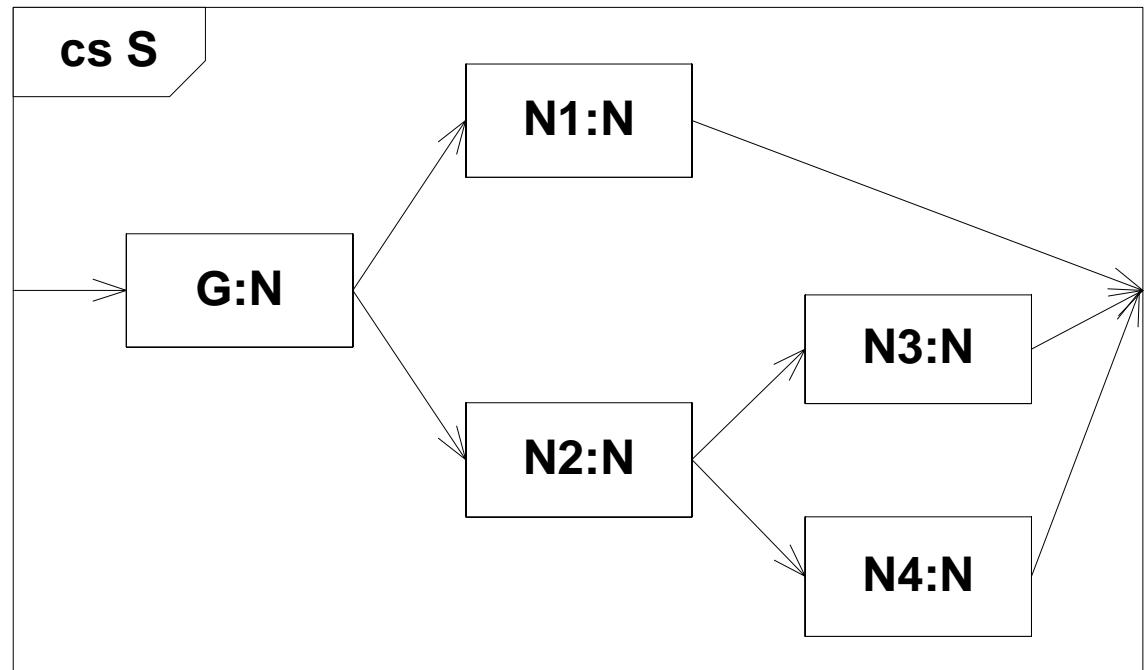

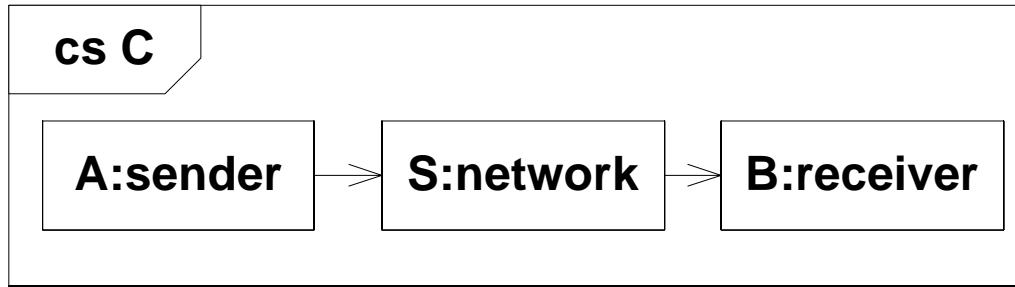

$$[[ d1 \text{ xalt } d2 ]]$$

$$= [[ d1 ]] \cup [[ d2 ]]$$

$$= (p1, n1) \cup (p2, n2)$$

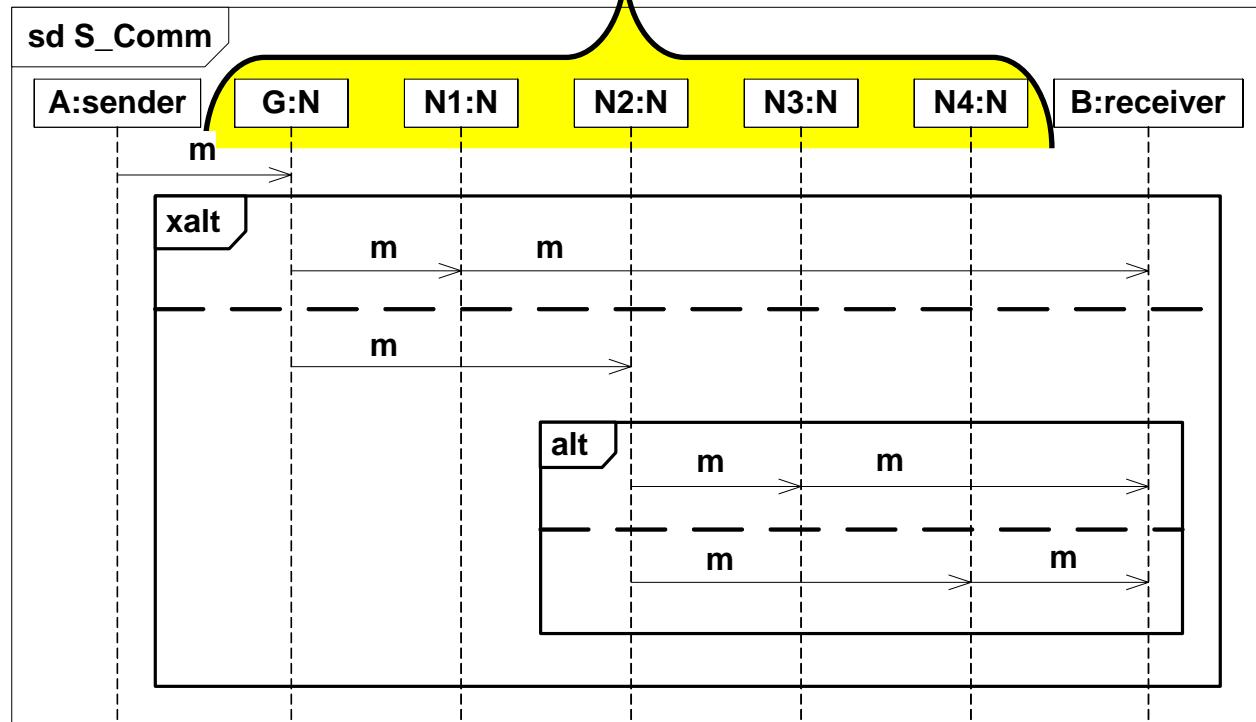

# Example: Network communication

# alt vs xalt

- Interactions as example runs
- Underspecification and nondeterminism
- Refinement 
- Data and guards

# Refinement in STAIRS

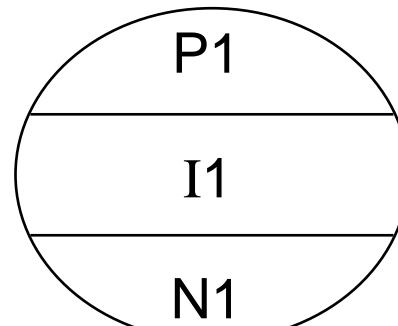

- An interaction obligation  $o'=(p',n')$  is a refinement of an interaction obligation  $o=(p,n)$  iff
  - $n \subseteq n'$
  - $p \subseteq p' \cup n'$

# Refinement contd.

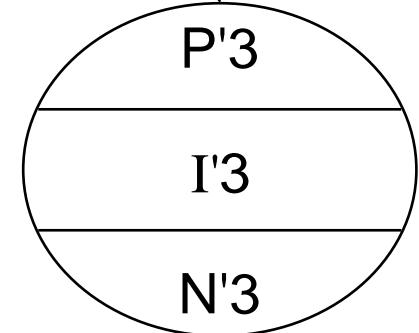

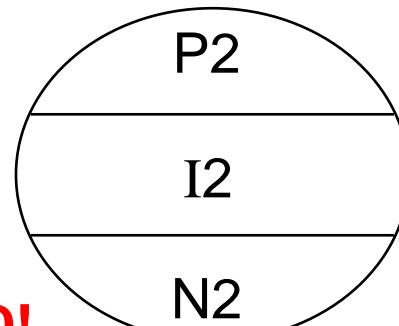

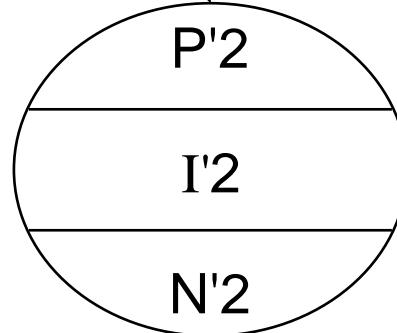

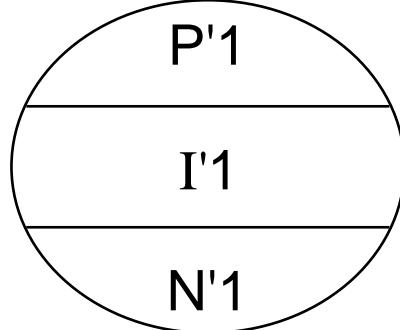

- An interaction  $d'$  is a refinement of an interaction  $d$  iff
$$\forall o \in [[d]]: \exists o' \in [[d']]: o \rightsquigarrow o'$$

$d:$

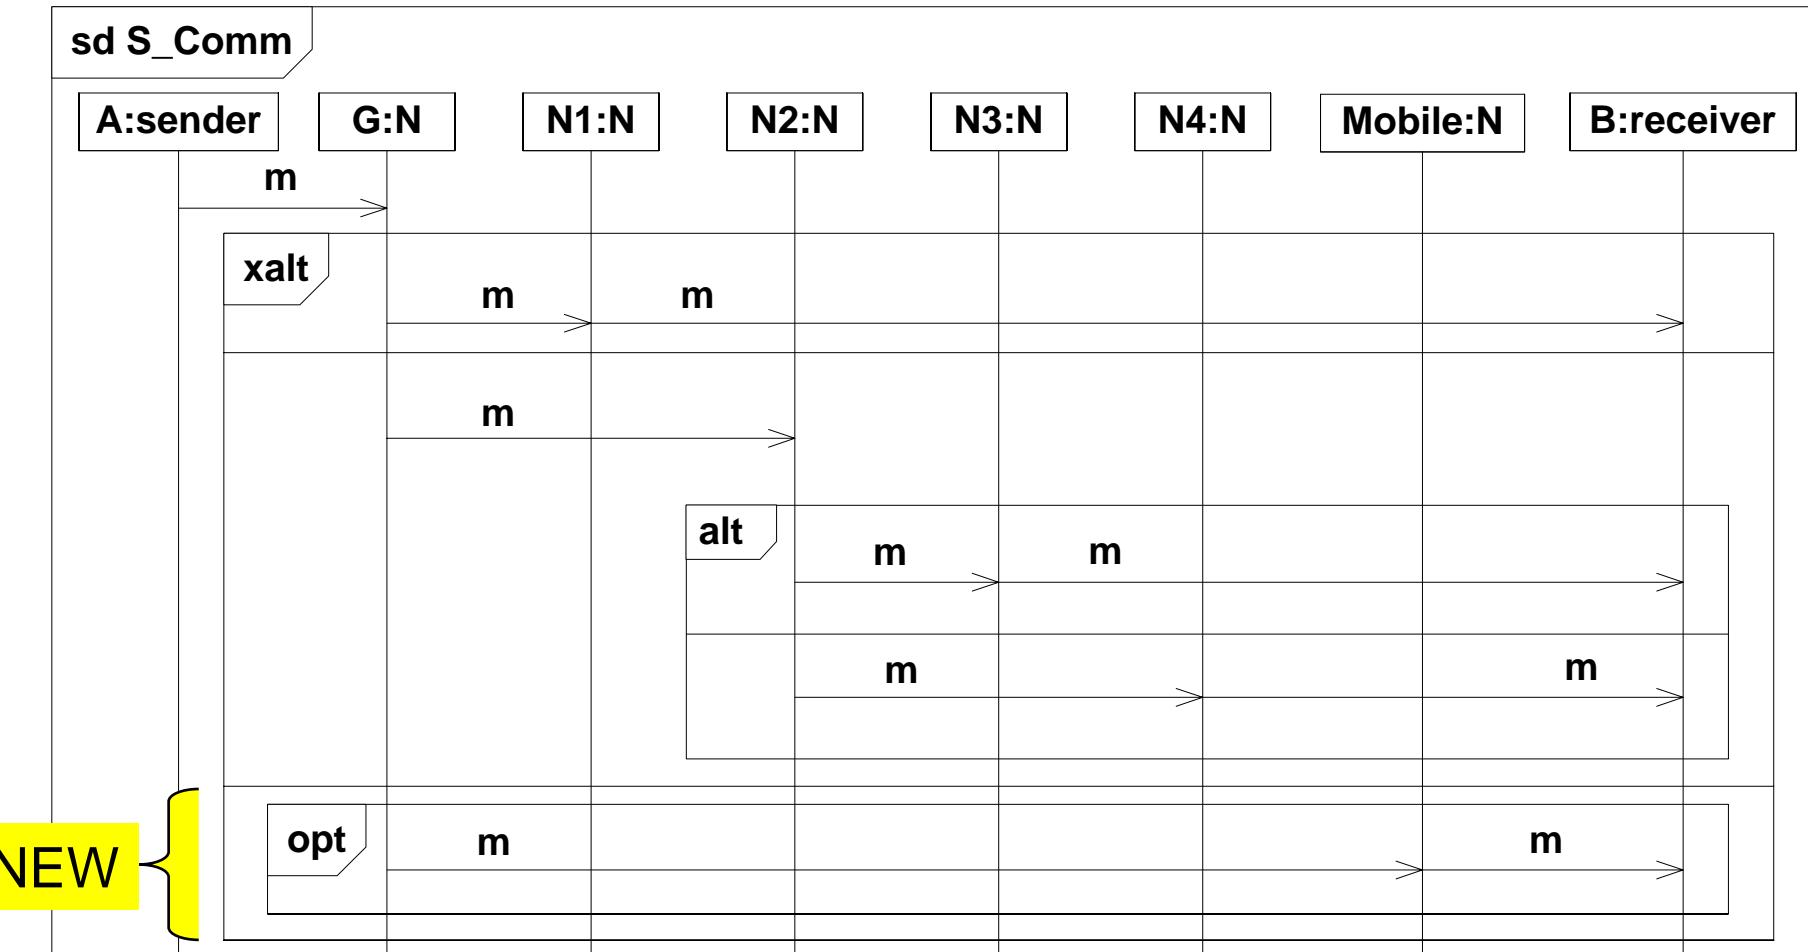

**NOT VALID!**
