

# HTML5 Standard and features

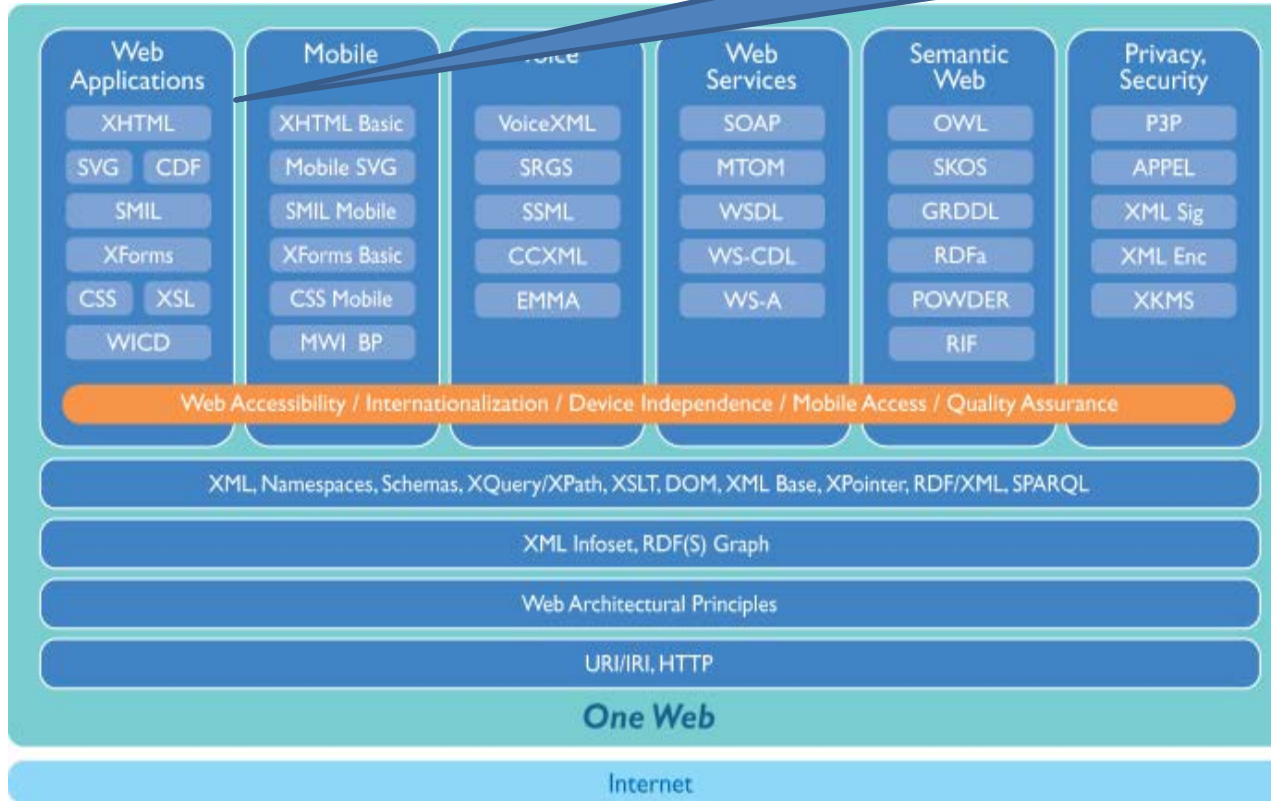

INF5750/9750 - Lecture 6 (Part I)

# Problem Area

- The core language of the World Wide Web is HTML
- The WWW is accessed through a number of devices
- Current HTML standard was designed for creating web pages that are accessed through browsers in computers with links to other web pages
- Today HTML is used to create Touch-screen websites, Games, 3D graphics, Audio-video conferencing, etc...
- Still we have to think whether our applications will work across devices

# How to solve → Standardization

- HTML is different from XHTML (WHATWG, 2004)
- WHATWG, a living HTML standard
- W3C uses version releases (HTML5, 2014. HTML5.1 – 2016)

- Testing browser compatibility part of the standard to check adherence
- *Remember Acid2 and Acid3?*

# HTML-syntax & XML-syntax

```
<!doctype html>
<html>
  <head>
    <meta charset="UTF-8">
    <title>Example document</title>
  </head>
  <body>
    <p>Example paragraph</p>
  </body>
</html>
```

```
<?xml version="1.0" encoding="UTF-8"?>
<html xmlns="http://www.w3.org/1999/xhtml">
  <head>
    <title>Example document</title>
  </head>
  <body>
    <p>Example paragraph</p>
  </body>
</html>
```

## Character Encoding & Doctype

```
<meta charset="UTF-8">
```

**Instead of**

```
<meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
```

**No more DTDs. (earlier used for HTML quirks mode) and since HTML was SGML-based**

```
<!DOCTYPE html>
```

**Instead of**

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01//EN"
"http://www.w3.org/TR/html4/strict.dtd">
```

**STRICT OR TRANSITIONAL**

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01
Transitional//EN" "http://www.w3.org/TR/html4/loose.dtd">
```

# What's different in HTML5

- 28+ new elements
- Many new attributes
- Many changed attributes
- Obsolete elements
- Obsolete attributes
- HTML5 does not use the terms "block-level" or "inline"
- New APIs
- Extensions

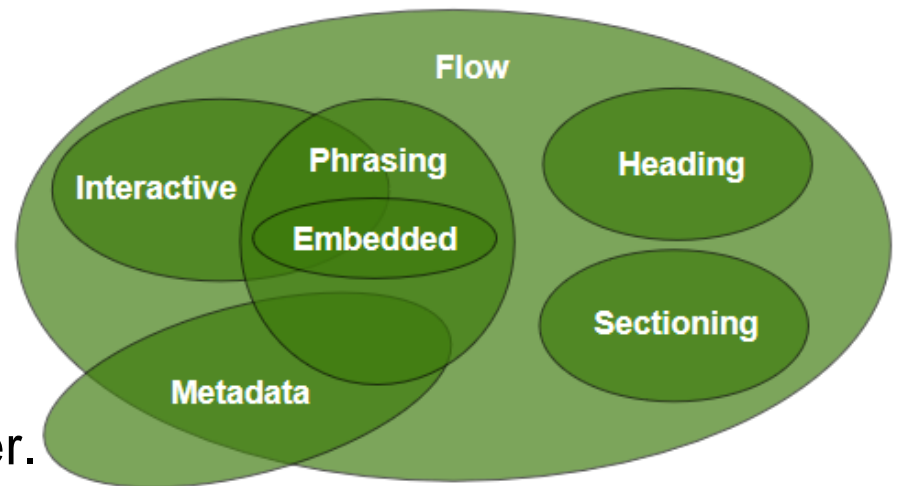

# Content Model - Categories

- Metadata content, e.g. link, script.
- Flow content, e.g. span, div, text.

This is roughly like HTML4's

"block-level" and "inline" together.

- Sectioning content, e.g. aside, section.
- Heading content, e.g. h1.
- Phrasing content, e.g. span, img, text. This is roughly like HTML4's "inline". Elements that are phrasing content are also flow content.
- Embedded content, e.g. img, iframe, svg.
- Interactive content, e.g. a, button, label. Interactive content is not allowed to be nested.

# New elements (commonly used ones)

- section – to define an application section. Used with h1, h2..
- main – only used once, to highlight main content
- header - a group of introductory or navigational aids
- footer – footer to a section, may contain author, copyright...
- nav – navigational part of the HTML
- figure/figcaption – self-contained flow content
- video/audio – multimedia content
- progress – to monitor progress of long processing tasks
- canvas – Used to render dynamic bitmap graphics
- input types – tel, search, url, email, datetime, month, week, time, datetime-local, range, color

# See examples for new elements

- <http://jsfiddle.net/sunbiz/4zJnE/>

- <http://jsfiddle.net/sunbiz/4JXkY/>

- <http://jsfiddle.net/sunbiz/KqymQ/>

- <http://sunnam.us/~saptarshi/>

- <http://jsfiddle.net/sunbiz/DqAF5/>

- <http://jsfiddle.net/sunbiz/xX5QB/>

- <http://www.senchalabs.org/philogl/demos.html>

# New attributes (commonly used ones)

- download – hyperlink to download a resources [a, area]
- charset – to specify character set [meta]
- autofocus – focused after page loads [input, select, button,...]
- placeholder – hint/tooltip shown [input, textarea]
- form – link element to form [input, select, fieldset, object...]
- required – data should be filled [input, select, textarea]
- many new attributes to input – autocomplete, min, max, ...
- async – asynchronous loading [script]
- manifest – application cache manifest – offline data [html]
- sizes – different sizes icons [link: type="icon"]
- crossorigin – getting image from another domain [img]

# Obsolete elements

Better done through CSS:

- *basefont*, *big*, *center*, *font*, *strike*, *tt*

Removed because they are bad from usability

- *frame*, *frameset*, *noframes* - (DO NOT CONFUSE `iframe`)

Confusing or duplicate ones removed

- *acronym* is removed. Instead use *abbr* for abbreviations.
- *applet* removed. Instead use *object*.
- *isindex* usage can be replaced by usage of form controls.
- *dir* removed. Instead use *ul*.
- *noscript* only in HTML and not XML

# New APIs

- *video/audio* have APIs for playback, with subtitles
- API for offline Web applications, using “*application cache*”
- Drag & drop API in combination with a *draggable* attribute
- *Location* interface exposing document's URL & navigation
- *History* interface exposing session history
- *atob()*, *btoa()* – Base64 encoding
- *setTimeout()*, *setInterval()* – timer based callbacks
- *postMessage()*, *MessageChannel* interface for cross-document and channel messaging
- *Worker*, *SharedWorker* interface for background scripts
- *localStorage*, *sessionStorage* – for offline data
- *WebSocket*, *EventSource* – client/server communication

# API examples

- Video API - <http://jsfiddle.net/sunbiz/P5DrC/4/>
- Custom Validation - <http://jsfiddle.net/sunbiz/uy9Ae/1/>
- Drag Drop & Base64 - <http://jsfiddle.net/sunbiz/b2FxK/2/>
- Worker & MessageChannel - <http://threadcomm.appspot.com/>

# Highly Innovative Changes

- Among the APIs, we can see some highly disruptive changes, that modify the way we've seen the WWW till date
  - WebSocket
  - LocalStorage, SessionStorage, IndexedDB (**Covered in Part II**)
  - WebRTC

# WebSockets

- WWW is largely based on so-called request/response paradigm of HTTP
- How does a server send information to client, when it wants to?? “Push data to client”
- HACK1: With long polling, the client opens an HTTP connection to the server which keeps it open until sending response
- Yuck2: Use Flash or Java applet and sockets from those
- Comes “Comet” and then standardized WebSocket to rescue!

# Code snippets

```
// Defining a connection. Currently SOAP and XMPP are supported sub-protocol
var connection = new WebSocket('ws://folk.uio.no/~saptarsp/echo', ['soap', 'xmpp']);

// When the connection is open, send some data to the server
connection.onopen = function () {
    connection.send('Ping'); // Send the message 'Ping' to the server
};

// Sending String
connection.send('your message');

// Sending canvas ImageData as ArrayBuffer
var img = canvas_context.getImageData(0, 0, 400, 320);
var binary = new Uint8Array(img.data.length);
for (var i = 0; i < img.data.length; i++) {
    binary[i] = img.data[i];
}
connection.send(binary.buffer);

// Sending file as Blob
var file = document.querySelector('input[type="file"]').files[0];
connection.send(file);
```

# WebSocket Demo

<http://labs.dinahmoe.com/plink/>

<http://html5demos.com/web-socket>

- Using WebSocket creates a whole new usage pattern for server side applications
- Such architectures are usually designed around either threading or so called non-blocking IO.

# WebRTC

- **WebRTC is a new front in the long war for an open and unencumbered web.**

— Brendan Eich, inventor of JavaScript

- Imagine a world where your phone, TV and computer could all communicate on a common platform.

WebRTC implements three APIs:

- MediaStream (aka getUserMedia)
- RTCPeerConnection
- RTCDataChannel
- <https://apprtc.appspot.com/>

# The War Goes On...

- On 2<sup>nd</sup> Oct, 2013, the W3C accepted proposal to include DRM as part of in HTML5
- The purpose of DRM is to give content providers leverage against creators of playback devices. (W3C, Ian Hickson)
- Mozilla's bug report - Pledge never to implement HTML5 DRM - [https://bugzilla.mozilla.org/show\\_bug.cgi?id=923590](https://bugzilla.mozilla.org/show_bug.cgi?id=923590)
