Please add only **one** slide with information about yourself and your research interests.

No animations, you should think of it as a static “poster” that you present in front of.

Tip: you don’t need to add so much information, instead, think about what could make people remember you later.

Place your slide in alphabetical order after your **first** name.

A picture of yourself that is related to your research may help!

FEEL THE BEAT AND IMPROVE THE GROOVE

MULTIMODAL RHYTHM PERCEPTION IN COCHLEAR IMPLANT USERS

The Usage of Creative Arts Therapies for African & Carribean Children & Adolescents with Psychiatric Disorders

Briana Applewhite, DPhil Candidate
Department of Psychiatry
Professor Morten Kringelbach
Dr Olivia Spiegler

UNIVERSITY OF OXFORD

RESEARCH QUESTION

Are creative arts therapies viable and culturally competent treatment options in Black racial minority youth suffering from psychiatric disorders?

23% of Black British people experience common mental disorders

Black adults have the lowest rate of recovery after engaging with mental health services

Black children have the highest risk of developing a mental health problem in adulthood

Phase 1

Systematic Review & Meta-analysis:
The usage of creative arts therapies for children and adolescents with symptoms of PTSD

Phase 2

Focus groups & Cross-sectional survey:
Discovering from patients, their carers, clinicians and community leaders regarding the relevancy of CATs and their usage with the target population

Phase 3

Intervention:
Utilizing music therapy and dance movement therapy with Black children and adolescents with PTSD; EEG tracing brain changes

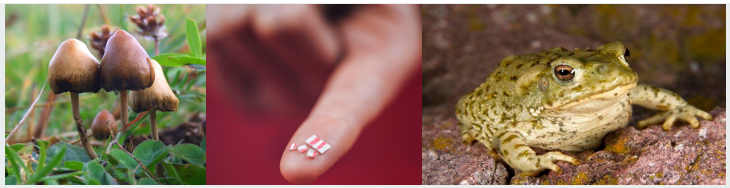
Psychedelics



- General question: How do psychedelics affect the brain and consciousness?

- More specific questions:
  - How do psychedelics perturb and shed light on the relationship between pharmacology, neuroimaging, and phenomenology (conscious experience)?
    - Meta-analysis in collaboration with Kat Jerotic
  - How do psychedelics make temporal sequences of brain activity more ordered or disordered?
    - INSIDEOUT project
      - Temporal irreversibility of MEG signals
      - Entropy production (part of thermodynamics of mind framework developed at our centre)

Maham Riaz

TOWARDS NOVELTY:

Perceiving and engaging with unfamiliar contexts within a strange Virtual Reality environment

Phenomenological Interviews

Consensus categories: clustering & intersubjective validation

Experiential Structure:

- from disorientation to familiarity
- dynamic cycle of 'affect'
- mediating action potentials & 'real' affordances
- curiosity & play
- the embodied self

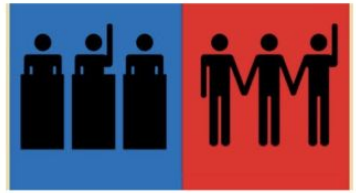
martin.pleiss@imv.uio.no

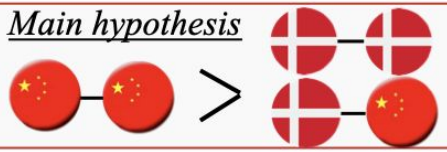
To coordinate or not to coordinate:
Social bias effects on musical communication

Background:
- Music is essentially a means of communication *(Cross, 2014)*
- Successful communication requires **coordination** *(LaCroix, 2020)*

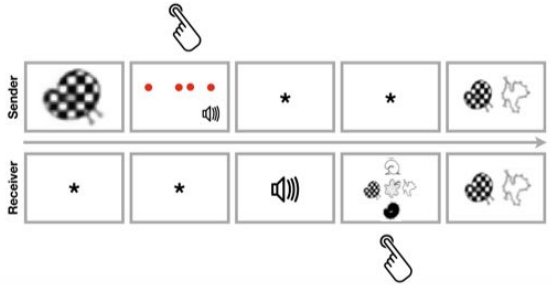
Research question:
- How does **cultural structures** (*collectivism* vs *individualism*) effect music coordination / communication?



Main hypothesis



- In-group bias (social bias)
- Interaction strategies
- Cross-modal integration



Methods (signalling game):
- Behavioural
- Magnetoencephalography (MEG)

Metrics:
- **Coordination** & asymmetry
- Convergence speed

Crossmodal Perception of Time and Rhythm in Film

I will investigate crossmodal integration of **audiovisual rhythms** in relation to

- Time perception
- Attention
- Absorption

- Self-composed music
- Film scenes
- Virtual Reality

- Eye tracking
- Pupillometry
- Behavioural responses

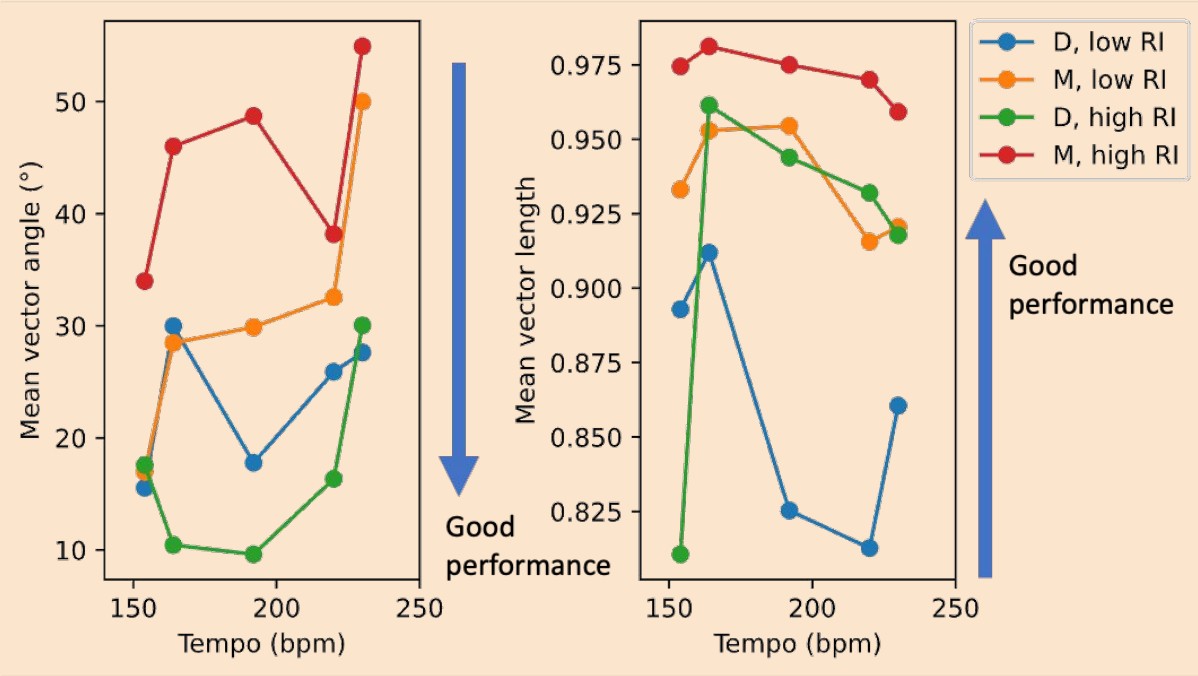
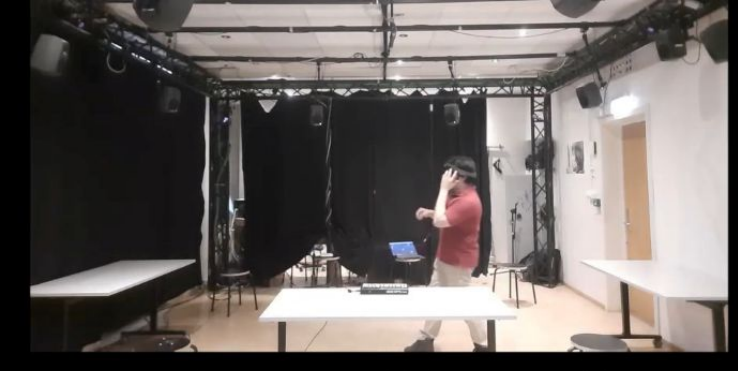
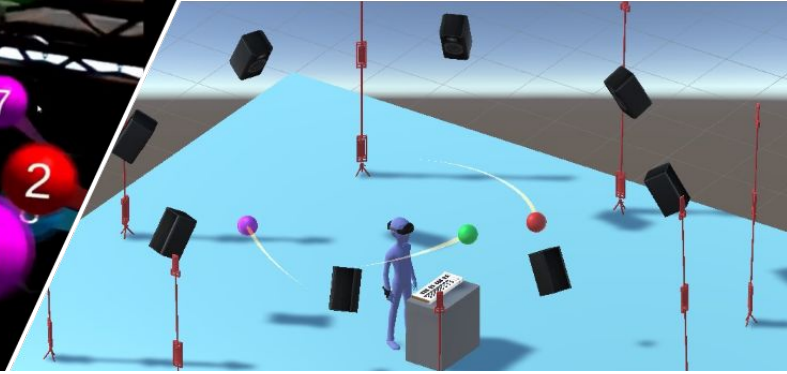
Tapping to Salsa Rhythms: Preliminary Pilot Findings



Mean vector angle (left, denotes inverse tapping accuracy) and length (right, denotes inverse tapping variability) for musicians (M) and Salsa dancers (D) for low rhythmic information (RI) and high RI stimuli at different tempi.

- Experienced dancers seem to have better accuracy than musicians at most tempi for low and high RI.
- Musician's variability is low at all tempi for low and high RI. Experienced dancers have higher variability for stimuli with low RI, and with high RI and low tempo.





Automatic Tempo Synchronization for Human-Machine Interactive Music Systems based on Autonomous Agents

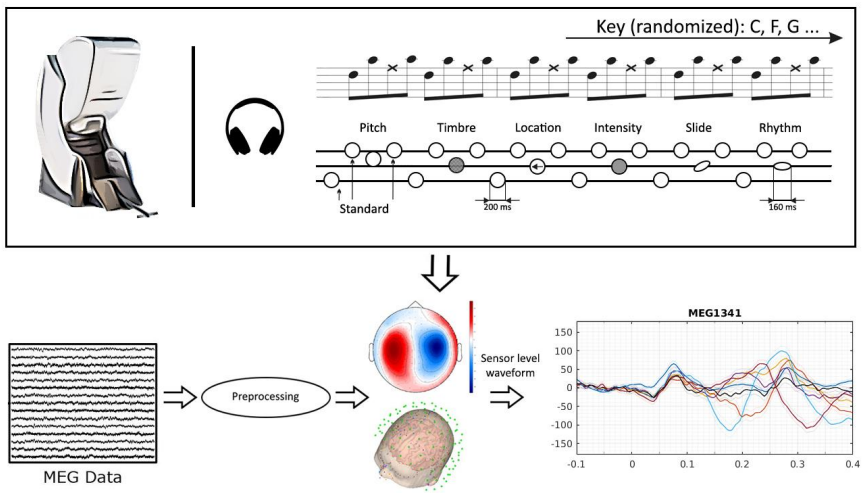
Fluid intelligence and auditory predictive processing: associations between MMN parameters and performance scores

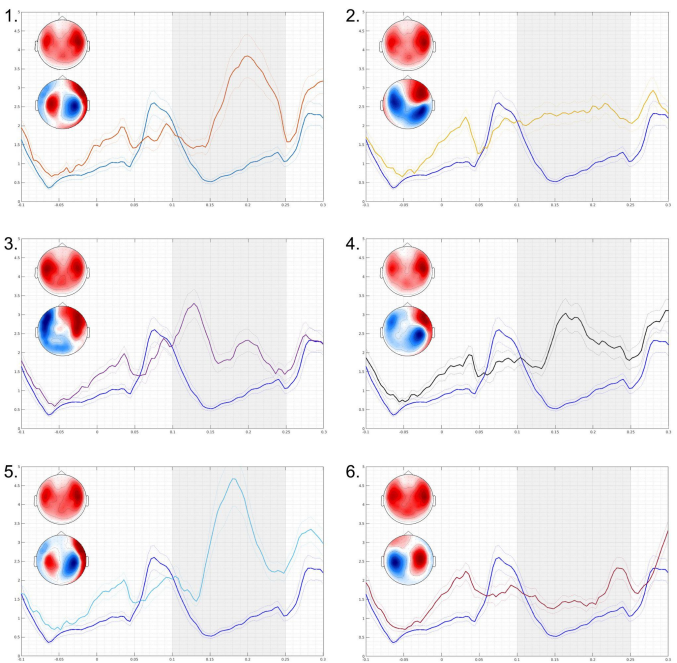
Campo, F. F., Carlomagno, F., Vuust, P., Haumann, N. T., Bonetti, L., Grube, M., Brattico, E.

Methods:

- **Aim of the study** → replicate and extend previous findings (Bonetti et al., 2018), and to investigate whether MMN is also related to gF.
- MEG data of **29 participants** were recorded while listening to the musical **multi-feature paradigm** → four-tone pattern played with piano tones, including a randomized **feature deviant** at the 3rd position;
- **Behavioural** measures of **intelligence** were assessed using the **WAIS-IV**.



- The analysis was performed on **combined gradiometers** for both frontal and temporal ROIs as in Bonetti et al. (2018).
- We performed then two RM-**ANOVAs**.



Results

We found a **significant relationship** between MMN and the Digit Span subscale on frontal and temporal ROIs, closely *replicating and extending* the previous results (Bonetti et al.; 2018).

Results suggest that intelligence is *related* to predictive processes occurring at a pre-attentive sensorial level.

Systematic review & meta-analysis: non-verbal auditory memory in the brain

Campo et al., 2023. *In progress*
