A brief introduction
to
Field Programmable Gate Arrays

Field Programmable Gate Array

- Integrated circuit including a matrix of general-purpose programmable logic blocks.
- Functions described by a Hardware Description Language (VHDL, Verilog) and mapped into pre-existing programmable logic (Configuration)
- True parallelism (concurrency)

Programmable logic block

Look-Up Table (LUT)

A1	A0	M
0	0	0
0	1	0
1	0	0
1	1	1

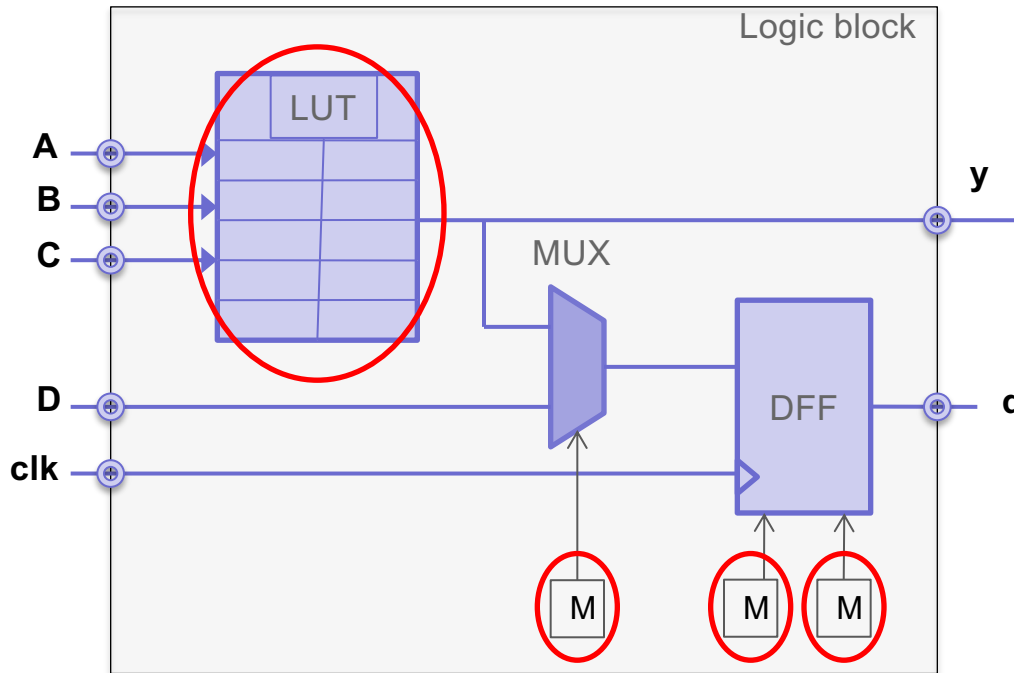

Two input AND-gate

Configuration bits

Configuration memory (LUT, M)
It defines the logic function and routing

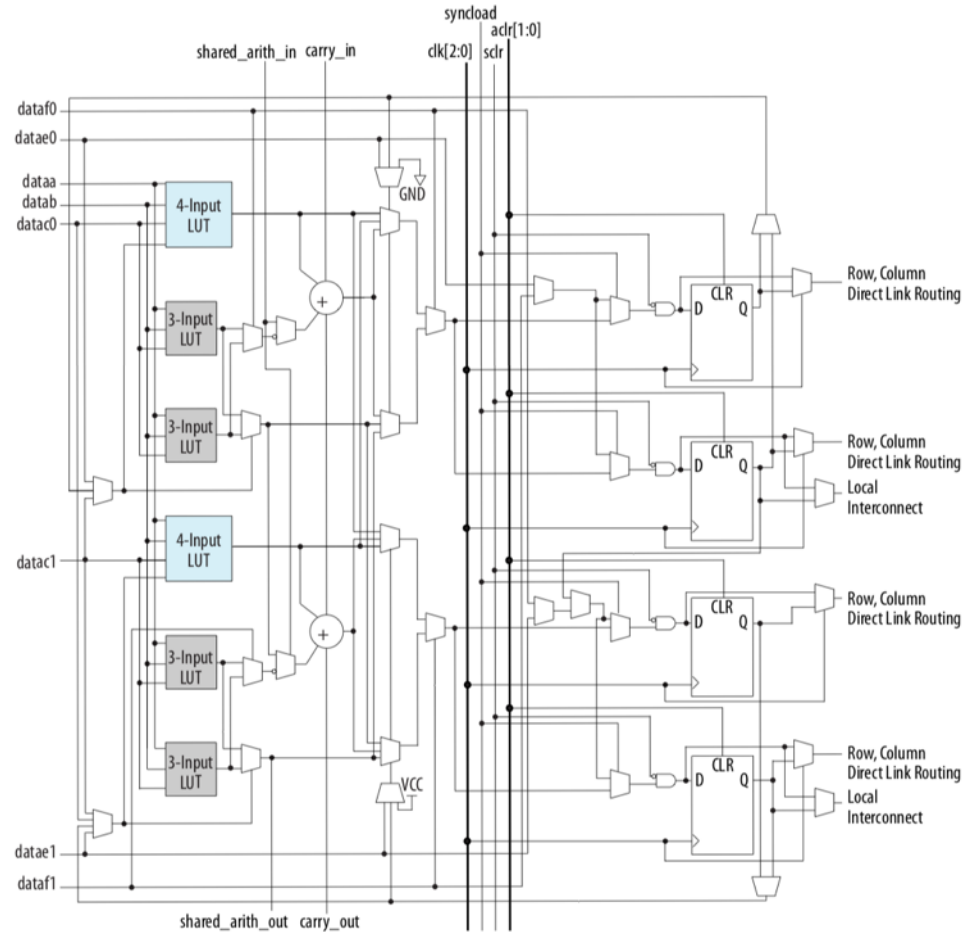

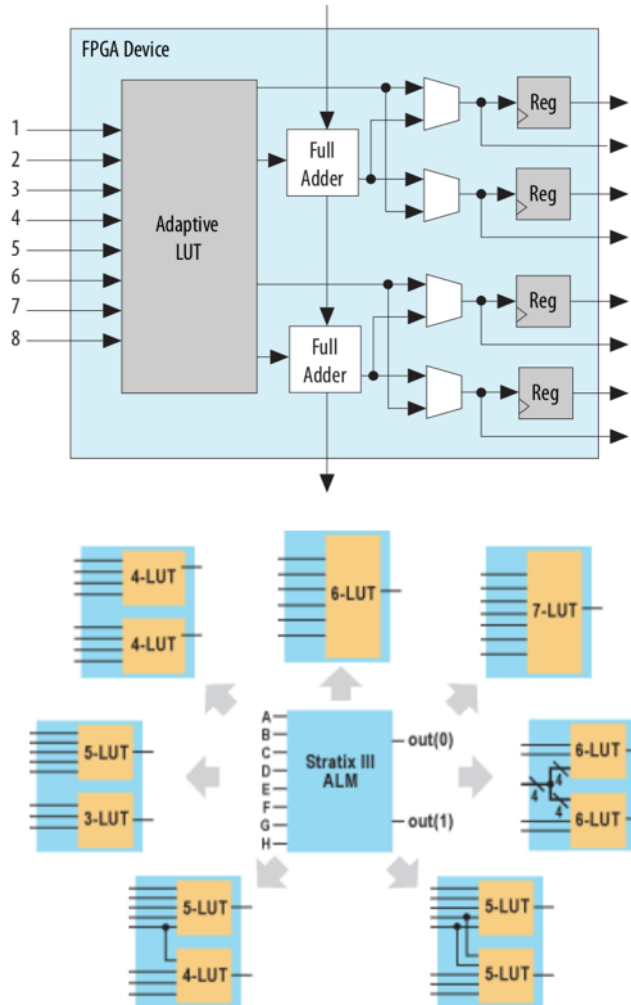

e.g. SRAM

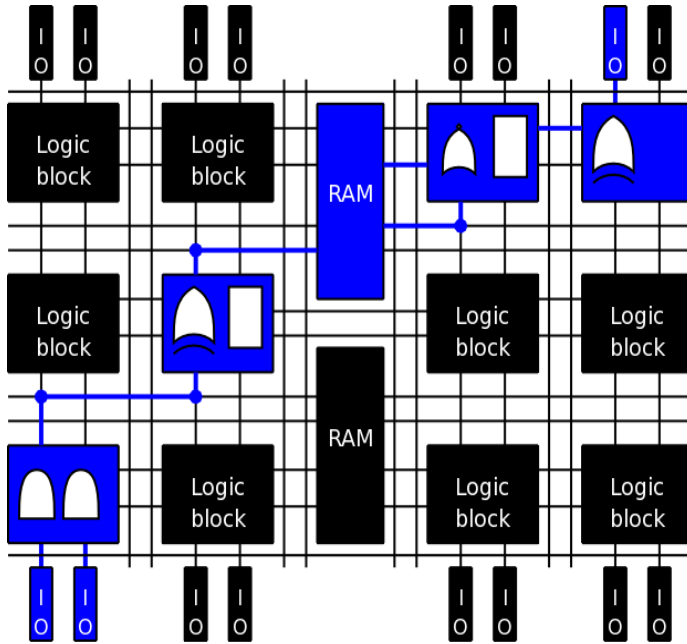

Additional FPGA resources (JTAG, POR, PLLs, etc)

From design to configuration

```

23 flipflop_proc: process(clk,areset_n)
24
25 begin
26   if (areset_n = '0') then
27     q <= '0' ;
28   elsif rising_edge(clk) then
29     q <= d ;
30   end if;
31 end process;
32
33 end behav;

High level synthesis (HLS)

- Automated process that interprets an algorithmic description of a desired behavior in a high-level development tool/language and creates digital hardware that implements that behavior.
 - C-code (development tool)
 - Matlab (HDL coder)
 - LabView (FPGA module)
- **Advantage:**
 - Easy to implement complex designs with e.g. mathematical operations and filters.
- **Disadvantage:**
 - Less control of the more complex HDL code.

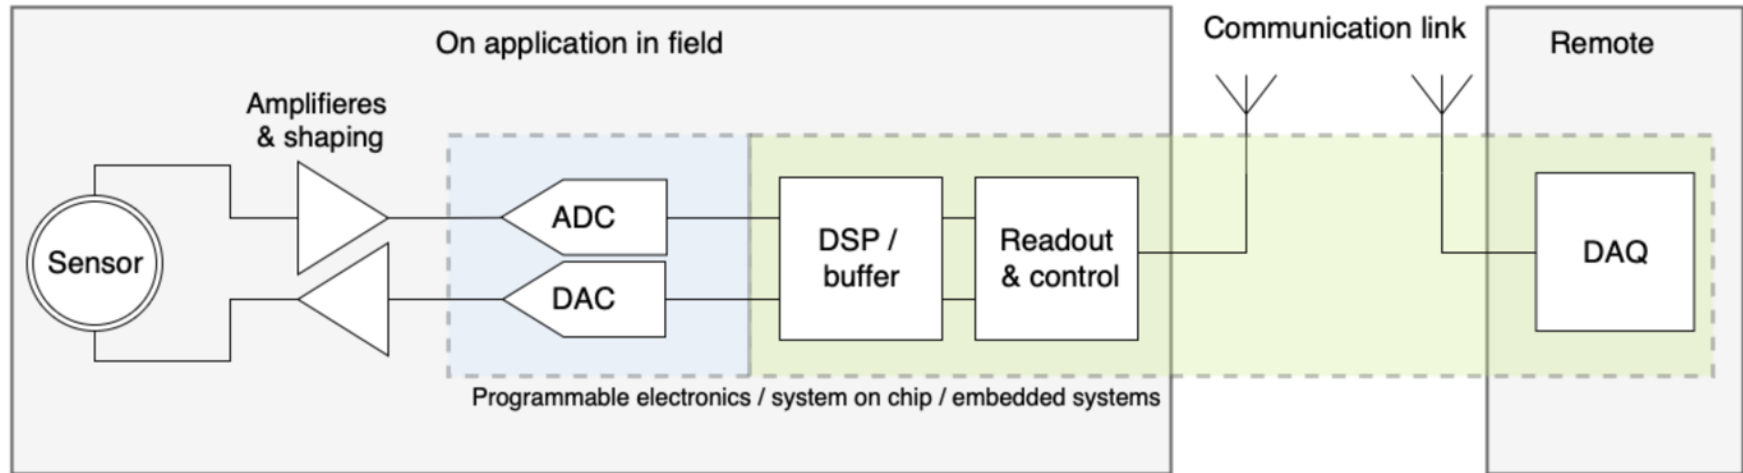

- Hard-core:
 - Modern FPGAs have Hard Processor Systems embedded in Silicon in addition to the programmable logic part.
- Soft-core:
 - Also possible to implement a CPU in HDL (soft-core)

Why FPGAs?

- Reconfigurable
- Short time to market (quick response to market demands)
- Excellent and low-cost choice for prototyping
- True parallelism with high I/O count
- High reliability, determinism & performance
- Can replace microcontrollers in designs with
 - A demand for high number & flexible I/O lines
 - A need for non-standard user interfaces
- Offers single chip solutions (SoC)

The answer is not always FPGAs

- Can be expensive compared to microcontrollers
- Often higher power consumption compared to microcontrollers
- High pin count => complex packaging (BGA)
- Complicated (i.e. clocking and timing)
- Complex tools
- HDL not necessarily easy or intuitive

- Often a microcontroller can do the job!
