

Element	Symbol	% in body
Oxygen	O	65.0
Carbon	C	18.5
Hydrogen	H	9.5
Nitrogen	N	3.2
Calcium	Ca	1.5
Phosphorus	P	1.0
Potassium	K	0.4
Sulfur	S	0.3
Sodium	Na	0.2
Chlorine	Cl	0.2
Magnesium	Mg	0.2
Others		< 1.0

The main elements that compose the human body are shown from most abundant (by mass, not by fraction of atoms) to least abundant.

Polar – hydrophilic – water soluble

(length appears different for perspective (3D))

Dept. Biol. Penn State ©2002

HYDROPHILIC MOLECULES

Substances that dissolve readily in water are termed **hydrophilic**. They include ions and polar molecules that attract water molecules through electrical charge effects. Water molecules surround each ion or polar molecule and carry it into solution.

Ionic substances such as sodium chloride dissolve because water molecules are attracted to the positive (Na^+) or negative (Cl^-) charge of each ion.

Polar substances such as urea dissolve because their molecules form hydrogen bonds with the surrounding water molecules.

Hydrophobe & amphiphile

Some hydrophobic molecules

octane

benzene

ether

Important molecules

- Important nitrogenous bases: Adenine, Thymine, Guanine, Cytosine, Uracil
- Nucleic acids
 - DNA (DeoxyriboNucleic Acid): base **pairs** T-A, C-G
 - RNA (RiboNucleic Acid): single strands of G,U,A,C
- Nucleotide = (nitrogenous) base + sugar + phosphate
 - Adenine (base) + ribose (sugar) = Adenosine
 - ATP (Adenosine TriPhosphate)
 - ADP (Adenosine DiPhosphate)

Important molecules

- fatty acids -> phospholipid -> membranes

Saturated Fatty Acid

Unsaturated Fatty Acid

- amino acids -> polypeptides - proteins

Amino: NH₂, Acid: OOH

Peptides: 2-50 amino acids
Proteins: >50 amino acids

Molecule databases

- atomify

Cells – fundamental functional units of life

- enclosed by **plasma membrane**
- interior «soup» called **cytoplasm**
- organized in **organelles** = specialized compartments surrounded by membrane
 - **nucleus**: contains the genetic information necessary for cell growth and reproduction
 - **mitochondria**: responsible for the energy transactions necessary for cell survival
 - **lysosomes**: digest unwanted materials within the cell
 - **endoplasmic reticulum & Golgi apparatus**: organization of the cell by synthesizing selected molecules and then processing, sorting, and directing them to their proper locations

Some typical cells

Plasma membrane

Cytoskeleton

- actin filaments (7 nm \varnothing)
- microtubules (25 nm \varnothing)
- intermediate filaments (10 \varnothing)

The eukaryotic cytoskeleton. Actin filaments are shown in red, and microtubules composed of beta tubulin are in green.

G-actin monomer
F-actin polymer

Crash course in greek and latin:

Angio-		Vessel	
-atomy, -otomy		cutting	Angiogenesis
Auto-	self		=production
Brachy		short	of vessels
Cata- (katalysis)		dissolving	
Carcino-		tumor (crab-like)	
Centro-, -centric		centre	Carcinogenesis
-ceptor, ceptive		capere, to take	=
Chromo-		color	Production
Chrono-		time	(development)o
-cyte, cyto-	hollow		f cancer
Diplo	double		
e-, ec-		out of	
Endo-	within, inside		
Exo-	outside		
Extra-	beyond		
Erythro-		red	
-gen, genous	descent		
-genic, -genous		birth, descent, origin	
-genic, -genous		to produce	

Crash course in greek and latin:

Glia-	glue
Haem-	blood
Histo-	tissue
Homeo-	alike
Homo-	the same
Hyper-	above
Hypo-	under
Infero-	beneath
Infra-	below
Inter-	between
Intra-	within
Iso-	equal
-kinesis, -kinetic	kinesis=movement
Leuko-	white
Lipo-	fat
-lysis, -lysin	dissolving
Macro-	large
Medi-	middle

Crash course in greek and latin:

-mere, mero-	a part	
Meta-	after	
Metabolism	change	Centromere=
Micro-	small	middle part
Mito- (mitosis)	a tread	
Mono-	single	
Muta-	mutare=to change	telomere=
Necro-	dead	end part
Neuro-	nerve	
-nomics	law	
Oligo-	few	
Onco-	bulk, mass	
Ortho-	straight	
Para-	beside	
Per-	through	
Peri-	around	
-phage, -phagous	phagein=to eat	
-phil	to love	

Crash course in greek and latin:

-phobe	to fear
Photo-	light
Plasma-, -plasm	form
-plicate	to fold
Post-	after
Pre-	before
Pro-	before
Proto-	first
Re-	back
Retro-	backwards
Serum	whey (myse)
-some, soma-	body
Stereo-, -steric	solid
Sub-	under
Super-	over
Supra-	above
Sym-, syn-	with

Crash course in greek and latin:

-synthesis	composition
Tauto-	the same
Tele-	far
Teleo-	complete
Telo-, telio-	end
Trans-	across
Ultra-	beyond

Statistical mechanics

- Model: MD (Atomify)
- micro $x_i, m_i, v_i, f_{ij}, 10^{23} \rightarrow$ macro $\rho, \langle v \rangle, \langle v^2 \rangle, E_k,$
- thermodynamics: P, T, c_p, H_v, \dots (stat + conservation laws)
- distributions: uniform, Gaussian, Poisson

$$P(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(x-x_0)^2}{2\sigma^2}}$$

- $x \rightarrow vx, x_0 \rightarrow 0, s$
- $\langle v \rangle, \langle v^2 \rangle$
- Model: ideal gas
