## EXERCISES WEEK 38 Tuesday

## 1) Exercise 2.2 a-d from K\&R

2) 

The momentum equations for ions and electrons are given by

$$
\begin{align*}
& \mathrm{m}_{\mathrm{i}} \frac{\mathrm{~d} \overrightarrow{\mathrm{v}}_{\mathrm{i}}}{\mathrm{dt}}=\mathrm{e}\left(\overrightarrow{\mathrm{E}}+\overrightarrow{\mathrm{v}}_{\mathrm{i}} \times \overrightarrow{\mathrm{B}}\right)  \tag{Eq. 1.1}\\
& \mathrm{m}_{\mathrm{e}} \frac{\mathrm{~d} \overrightarrow{\mathrm{v}}_{\mathrm{e}}}{\mathrm{dt}}=-\mathrm{e}\left(\overrightarrow{\mathrm{E}}+\overrightarrow{\mathrm{v}}_{\mathrm{e}} \times \overrightarrow{\mathrm{B}}\right) \tag{Eq. 1.2}
\end{align*}
$$

a) Assume a static uniform electric field along the $y$-axis and a static uniform magnetic field along the $z$-axis. Sketch the particle trajectories separately for electrons and ions.
b) Show that the zeroth order drift of the guiding center is given by

$$
\begin{equation*}
\overrightarrow{\mathrm{v}}_{\mathrm{gc}}=\overrightarrow{\mathrm{u}}_{\mathrm{E}}=\frac{\overrightarrow{\mathrm{E}}_{\perp} \times \overrightarrow{\mathrm{B}}}{\mathrm{~B}^{2}}, \tag{Eq. 1.3}
\end{equation*}
$$

independent of both the mass and charge.
$\{$ Hint: $\vec{a} \times(\vec{b} \times \vec{c})=\vec{b}(\vec{a} \cdot \vec{c})-\vec{c}(\vec{a} \cdot \vec{b})\}$
c) Assume a magnetic field along the $z$-direction increasing in strength with increasing $y$, and no electric field. Draw a sketch showing the particle trajectories separately for ions and electrons.

Assume that the magnetic field strength increase linearly with increasing $y$.
d) Show that the magnetic field can be expressed as

$$
\begin{equation*}
\mathrm{B}_{\mathrm{z}}=\mathrm{B}_{0 \mathrm{z}}+\left(\frac{\partial \mathrm{B}_{\mathrm{z}}}{\partial \mathrm{y}}\right) \mathrm{r}_{\mathrm{c}} \cos \phi \tag{Eq. 1.4}
\end{equation*}
$$

where $\mathrm{r}_{\mathrm{c}}=\frac{\mathrm{mv}_{\perp}}{\mathrm{eB}_{\mathrm{z}}}$ is the gyro radius, and $\phi$ is the angle that the position vector $\overrightarrow{\mathrm{r}}=(\mathrm{x}, \mathrm{y})$ makes with $y$ in a guiding center reference frame.
e) Show that the average forces over one gyro-period are given by

$$
\begin{equation*}
\left\langle\mathrm{F}_{\mathrm{x}}\right\rangle=\frac{-\mathrm{qv}_{\perp}}{2 \pi} \int_{0}^{2 \pi}\left(\mathrm{~B}_{0 \mathrm{z}} \sin \phi+\mathrm{r}_{\mathrm{c}}\left(\frac{\partial \mathrm{~B}_{\mathrm{z}}}{\partial \mathrm{y}}\right) \sin \phi \cos \phi\right) \mathrm{d} \phi \tag{Eq. 1.5}
\end{equation*}
$$

and

$$
\begin{equation*}
\left\langle\mathrm{F}_{\mathrm{y}}\right\rangle=\frac{-\mathrm{qv}_{\perp}}{2 \pi} \int_{0}^{2 \pi}\left(\mathrm{~B}_{0 \mathrm{z}} \cos \phi+\mathrm{r}_{\mathrm{c}}\left(\frac{\partial \mathrm{~B}_{\mathrm{z}}}{\partial \mathrm{y}}\right) \cos ^{2} \phi\right) \mathrm{d} \phi \tag{Eq. 1.6}
\end{equation*}
$$

in $x$ and $y$ directions, respectively.
f) Integrate Eqs. 1.5 and 1.6 and derive the following expression for the gradient drift of the guiding center:

$$
\begin{equation*}
\overrightarrow{\mathrm{v}}_{\mathrm{gc}}=-\frac{1}{2} \frac{\mathrm{mv}_{\perp}^{2}}{\mathrm{qB}_{\mathrm{z}}^{2}}\left(\frac{\partial \mathrm{~B}_{\mathrm{z}}}{\partial \mathrm{y}}\right) \hat{\mathrm{x}} \tag{Eq. 1.7}
\end{equation*}
$$

\{Hint: $\left.\int \cos ^{2} \mathrm{xdx}=\frac{1}{2} \sin \mathrm{x} \cos \mathrm{x}+\frac{1}{2} \mathrm{x}+\mathrm{C} ; \int \sin \mathrm{x} \cos \mathrm{x} d \mathrm{x}=\frac{1}{2} \sin ^{2} \mathrm{x}+\mathrm{C}\right\}$

The general expression for the gradient drift is:

$$
\begin{equation*}
\overrightarrow{\mathrm{u}}_{\mathrm{VB}}=\frac{1}{2} \mathrm{mv}_{\perp}^{2} \frac{\overrightarrow{\mathrm{~B}} \times \nabla \overrightarrow{\mathrm{B}}}{\mathrm{qB}^{3}} \tag{Eq. 1.8}
\end{equation*}
$$

## 3) Exercise $\mathbf{2 . 4}$ from K\&R
