

Mandatory Exercise DIGHEL4360 – Relational Databases and SQL

Published: 18.10.2022.

Deadline: 31.10.2022 23:59.

Files to deliver: 1: oblig2.pdf.

Number of attempts: 2.

In this mandatory assignment we will reuse the database we introduced in the weekly exercises. The database's three tables are listed in the appendix of this document:

- The table named **region** lists all regions in Norway, together with its name, area in square kilometers, and the health-region it is contained in.
- The table named **hospital** lists all the public hospitals in Norway, together with their name, the region it is contained in, the patient base, and the number of employees.
- The table named **primary_care_use** lists the use of primary care in total cases for each group of disorder (*mental* is short for *mental symptoms and disorders*, *cardiovascular* is short *cardiovascular disease* and *musculoskeletal* is short for *musculoskeletal system*) based on region and year.

Exercise 1 – Information as tables

We want to extend the relational database above to also store information about employees of *hospitals* and their schedule. So make a collection of tables able to contain the following information:

- Hospitals have employees, where each employee is uniquely identified by a *employee number*, has a *position*, a *first name* and a *surname*. Note that an employee may be employed by multiple hospitals.
- Hospitals have schedules that lists when each employee is set up to work in the near future. The schedule lists the *employee*, the *hospital*, and a *from* and *to* timestamps for when the work will take place.

Below are some examples of the data that can be stored in the database:

- Employee with *employee number* 768 has *position* nurse, *first name* Ola and *surname* Norman, and *works for* Haukeland universitetssykehus.
- Employee with *employee number* 471 has *position* surgeon, *first name* Kari and *surname* Nilsen, and *works for* both Haukeland universitetssykehus and Oslo universitetssykehus.
- Employee 768 is scheduled to work at Haukeland universitetssykehus *from* 2022-10-20 09:00 *to* 2022-10-20 17:00.
- Employee 768 is scheduled to work at Haukeland universitetssykehus *from* 2022-10-21 20:00 *to* 2022-10-22 07:00.
- Employee 471 is scheduled to work at Haukeland universitetssykehus *from* 2022-10-19 20:00 *to* 2022-10-20 07:00.
- Employee 471 is scheduled to work at Oslo universitetssykehus *from* 2022-10-25 07:00 *to* 2022-10-26 07:00.

Create tables that can store the information given above. Structure the tables so that there is no data duplication (as described during the lecture). Also add the example data above into your tables.

It does not matter how/where you make the tables (e.g. draw them on paper or use a tool on your computer that can make tables), just make sure that you can include it in the document you solve the other exercises in.

Exercise 2: SQL

If you go to the following web-page:

<https://dbfiddle.uk/DP9PuyWC?hide=2>

you are taken to a webpage that has loaded all of the data from the tables you used in exercise 1 into a database, over which you can write SQL-queries. On the webpage there is already written a SQL-query (to the left) that find the number of primary care in the *mental* category in the year *2020* for each region. The result of this query is on the right-hand side of the page.

If you either edit the query directly, or click the pluss-button below it to get a new text-box where you can write a new query. Click the big "run"-button at the top of the page to run your query.

Write an SQL-query that finds:

1. all data in the `primary_care_use`-table. (66)
2. the name of the health-region for the region with name `Viken`. (1)
3. the name and number of employees for all hospitals with a patient base between 150 000 and 250 000. (5)
4. the region, year and number of primary care use in both the *cardio-vascular*-category and the *mental*-category in `Oslo` and `Viken` for each year between (inclusive) 2016 and 2019. (8)
5. the number (count) of hospitals in *Innlandet*. (1)
6. the total number (sum) of `mental` primary care use in `Nordland` in the years before *2020*. (1)

The numbers in parenthesis is the number of expected rows your query should return. The number of rows returned by a query is written after the `SELECT`-keyword below all of the results.

Delivery

Hand in a single PDF-document containing your answers to the exercises (i.e. comments, tables, and SQL-queries) to Devilry¹. Make sure you are registered in the system by logging in and checking that the assignment `oblig3` is available. If you are not registered, please contact one of the lecturers in the course via email.

You can upload files as many times as you want until the deadline, only the last uploaded file will be graded. For more information about mandatory assignments, see IFIs webpages².
