Test Management: Part II

Software Testing: IN3240 / IN4240

Summary

Test organisation

Independence | Tasks of the test leader and testers

Test planning and estimation

Activities | Entry and exit criteria | Estimation | Strategy and approach

Test progress monitoring and control

Configuration and management

Risk and testing

Part I: Close-ended questions

Which of the following metrics would be most useful to monitor during test execution?

- a. Percentage of test cases written
- b. Number of test environments remaining to be configured
- c. Number of defects found and fixed
- d. Percentage of requirements for which a test has been written

Question 1: Clues

Which of the following metrics would be most useful to monitor during test execution?

Test progress monitoring

Give feedback and visibility of the test effort / activities

Monitoring information can be collected manually / automatically

Metrics can be used to measure exit criteria

Common test metrics

% of work done in test case preparation

% of work done in test environment preparation

Test case execution (e.g. number of tests run/not run)

Test coverage (requirements, risks, code)

Defect information (e.g. defect density, found / fixed)

Subjective confidence of testers in the product

Dates of test milestones

Testing costs

In a test summary report, the project's test leader makes the following statement:

"The payment processing subsystem fails to accept payments from American Express cardholders, which is considered a must-work feature for this release."

This statement is likely to be found in which section?

- a. Evaluation
- b. Summary of activities
- c. Variances
- d. Defect description

Question 2: Clues

This statement is likely to be found in which section?

Test reporting

Summarising information about the test effort

What happened during a test period?

E.g. dates when exit criteria were met

Analysed metrics to support decisions about future actions

Adequacy of the test objectives for that test level

Adequacy of the test approaches taken

Effectiveness of the testing with respect to its test objectives

Question 2: Clues

This statement is likely to be found in which section?

"The payment processing subsystem fails to accept payments from American Express cardholders, which is considered a must-work feature for this release."

IEEE 829 Standard: TEST SUMMARY REPORT

Test summary report identifier

Summary

Identify all relevant support materials Test items / Environment / References

Variances

Document changes or deviations from test plan

Comprehensiveness assessment

Evaluation of the test effort in terms of objectives Assess quality / effectiveness of testing

Summary of results

Report overall status of incidents
Defect patterns / Open, unresolved incidents

Evaluation

Assess quality of the software
Limitations → Incomplete or partial functions
Failure likelihood

Summary of activities Approvals

During an early period of test execution, a defect is located, resolved and confirmed as resolved by re-testing, but is seen again later during subsequent test execution.

Which of the following is a testing-related aspect of configuration management that is most likely to have broken down?

- a. Traceability
- b. Confirmation testing
- c. Configuration control
- d. Test documentation management

Question 3: Clues

Which is a testing-related aspect of configuration management most likely to have broken down?

Configuration Management

Establish and maintain the integrity of the products of the software

Components

Data

Documentation

Integrity → Assurance of the accuracy and consistency of data through the life cycle

Ensure that all items of testware are:

Identified

Version controlled

Maintain traceability throughout the test process

Tracked

You are working as a tester on a project to develop a point-of-sales system for grocery stores. Which of the following is a product risk for such a project?

- a. Arrival of a more reliable competing product on the market
- b. Delivery of an incomplete test release to the first cycle of system test
- c. An excessively high number of defect fixes fail during re-testing

d. Failure to accept allowed credit cards

Question 4: Clues

Which of the following is a product risk for a point-of-sales system?

Risks

Possibility of a negative / undesirable outcome

Possible problems that may endanger the objectives of the project stakeholders

Risk analysis and management aid in managing possible negative outcomes

Two main categories of risks

Product risks

Project risks

Question 4: Clues

Which of the following is a product risk for a point-of-sales system?

Product Risks

Potential failure areas in the software

Risks specifically related to the quality of the product

Failure-prone software

Software / Hardware that could case harm to the user

Poor software characteristics

Software that does not perform its intended functions

A product risk analysis meeting is held during the planning period. Which of the following determines the level of risk?

- a. Difficulty of fixing related problems in code
- b. The harm that might result to the user
- c. The price for which the software is sold
- d. The technical staff in the meeting

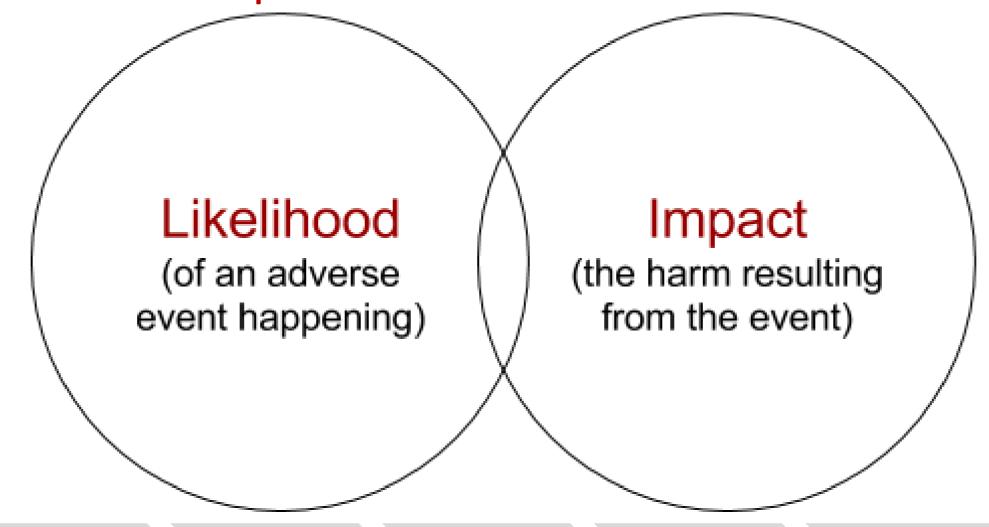

Question 5: Clues

What determines the level of risk during a product risk analysis meeting in the planning period?

Determining the level of risk

Likelihood → What are the chances?

Impact → What are the consequences?

You are writing a test plan using the IEEE 829 template and currently completing the Risks and Contingencies section. Which of the following is most likely to be listed as a project risk?

- a. Unexpected illness of a key team member
- b. Excessively slow transaction-processing time
- c. Data corruption under network congestion
- d. Failure to handle a key use case

Question 6: Clues

Which of the following is most likely to be listed as a project risk?

Project risks

Risks that surround the project's capability to deliver its objectives

Risks specifically related to aspects of the project processes

Organisational factors

Shortage of people, skill, training | Communication and attitude problems

Technical issues → Problems defining the right requirements

Supplier issues → Third-party failures

You and the project stakeholders develop a list of product risks and project risks during the planning stage of a project. What else should you do with those lists of risks during test planning?

- a. Determine the extent of testing required for the product risks and the mitigation and contingency actions required for the project risks
- b. Obtain the resources needed to completely cover each product risk with tests and transfer responsibility for the project risks to the project manager
- c. Execute sufficient tests for the product risks, based on the likelihood and impact of each product risk and execute mitigation actions for all project risks

d. No further risk management action is required at the test planning stage

Question 7: Answer

What else should you do with those lists of product and project risks during test planning?

Risk-based approach during the planning stage

Product risks

Determine the extent of testing to be carried out

Prioritise testing in an attempt to reveal critical defects as early as possible

Project risks

Identify risk items

Determine likelihood and impact for each item

Define mitigation and contingency actions for the identified risks

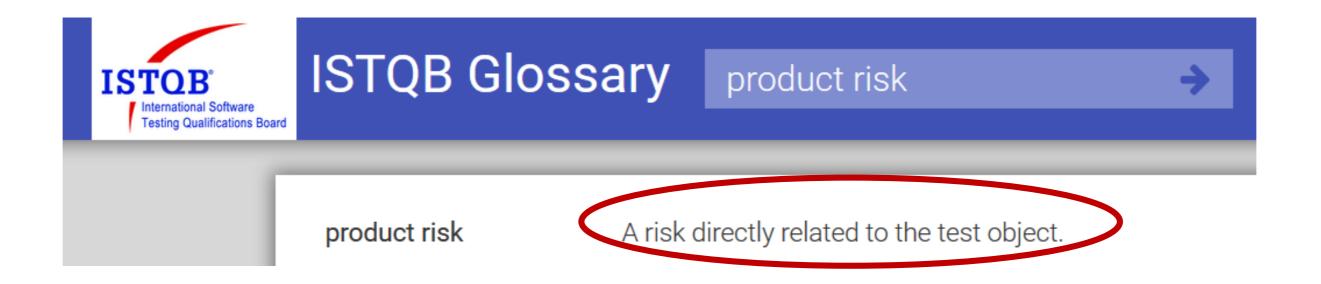

According to the ISTQB Glossary, a product risk is related to which of the following?

- a. Control of the test project
- b. The test object
- c. A single test item
- d. A potential negative outcome

Question 8: Clues

According to the ISTQB Glossary, a product risk is related to which of the following?

Product risk: ISTQB definition

Project risk:

"A risk related to management and control of the project"

E.g. lack of staffing, strict deadlines, changing requirements, etc.

Typical test strategies include:

- 1. Risk-based testing
 Testing directed to areas of greatest risk
- 2. Failure-based testing
 Test more in failure-prone areas
- 3. Management-directed testing
 Test first the areas indicated by the org. management

Which are true and which are false?

Question 9: Clues

Risk-based testing

Idea: Can organise test effort to reduce the residual level of risk

Use of risk analysis to prioritise and emphasise appropriate tests

Guide planning, specification, preparation, and execution

Analysis and risk identification starts early in the project

Involves both preventive (mitigation) and damage control (contingency) measures

Mitigation \rightarrow Testing to provide opportunities to reduce likelihood of defects

Contingency Testing to identify work-arounds for the defects that aren't discovered

Question 9: Clues

Failure-based testing

Idea: Can organise test effort based on failure-prone areas

Identifies areas most likely to hold defects, based on complexity

Some functionality is harder to implement than other

These areas are more vulnerable to defects

Starts early in the project and conducted throughout the life cycle

New problems / challenges will always emerge

Management-directed testing

This is not a defined test strategy in the ISTQB syllabus

In a defect report, the tester makes the following statement:

"At this point, I expect to receive an error message explaining the rejection of this invalid input and asking me to enter a valid input. Instead, the system accepts the input, displays an hourglass for between one and five seconds, and finally terminates abnormally, giving the message [Unexpected data type: 15. Click to continue]"

This statement is likely to be found in which of the following sections of a IEEE 829 Defect Report?

- a. Summary
- b. Impact
- c. Item pass / fail criteria
- d. Defect description

Question 10: Clues

This statement is likely to be found in which of the following

sections of an IEEE 829 Defect Report?

"At this point, I expect to receive an error message explaining the rejection of this invalid input and asking me to enter a valid input. Instead, the system accepts the input, displays an hourglass for between one and five seconds, and finally terminates abnormally, giving the message [Unexpected data type: 15. Click to continue]"

IEEE 829 Standard:

TEST DEFECT REPORT

Test defect report identifier

Summary

Summary of actual defect

References to:

Test procedure used to discover the defect Test logs showing actual execution of cases

Defect description

Detailed explanation of defect

Inputs / Expected results

Anomalies

Procedure step

Impact

Report actual damage caused by defect Severity / Priority assessment

According to the ISTQB Glossary, what do we call a document that describes any event that occurred during testing which requires further investigation?

- a. A bug report
- b. A defect report
- c. A test summary report

Question 11: Clues

According to the ISTQB Glossary, what do we call a document that describes any event that occurred during testing which requires further investigation?

Defect

Discrepancies between actual and expected test outcomes

Defect management

The process of recognising, investigating, taking actions, and disposing of defect

Defect report

A document reporting on any suspicious event that occurred during testing

Requires further investigation

A product risks analysis is performed during the planning stage of the test process. During the execution stage, the test manager directs testers to classify each defect report by the known product risk it relates to (or by 'other').

Once a week, the test manager runs a report that shows the percentage of defects related to each known product risks, and to unknown risks. What is one possible use of such a report?

- a. To identify new risks to system quality
- b. To locate defect clusters in product subsystems
- c. To check risk coverage by tests
- d. To measure exploratory testing

Question 12: Clues

What is one possible use for a report showing defects related to known product risks and unknown risks?

Objectives of a defect report

Provide developers with feedback about defects to:

Enable identification, isolation, and corrective measures

Provide test leaders with feedback about defects to:

Track system quality

Measure test progress

Provide ideas for test process improvement

Identify potential new risks to system quality
