Linear Temporal Logic for Hyperproperties (HyperLTL)

Course: Specification and Verification of Parallel Systems

29 November 2019

Presented by: Elahe Fazeldehkordi

Hyperproperties

- Trace: a sequence of states
- System: is modeled by a non-empty set of infinite traces, called its executions
- Trace property: a set of infinite traces

If systems are modeled as sets of execution traces, then the extension of a system property is a set of sets of infinite traces or, equivalently, a set of trace properties. This type of set is named a **hyperproperty**.

Every property of system behavior (for systems modeled as trace sets) can be specified as a hyperproperty.

Important security policies cannot be expressed as properties of individual execution traces of a system.

 whether a trace is allowed by the policy depends on whether another trace is also allowed

Hyperproperties can describe:

- trace properties
- security policies, such as:
 - noninterference
 - mean response time

HyperLTL

- By Clarkson et al. 2014 is an extension of LTL for specifying hyperproperties.
- Generalizes linear-time temporal logic (LTL)
- Examines more than one execution trace at a time
- Allows explicit quantification over multiple execution traces simultaneously
- Allows propositions that stipulate relationships among those traces
- Provides a simple and unifying logic in which many information-flow security policies can be directly expressed

LTL and HyperLTL

- Trace properties are typically specified in temporal logics, most prominently in Linear Temporal Logic (LTL).
- Verification of LTL specifications is routinely employed in industrial settings and marks one of the most successful applications of formal methods to real-life problems.
- LTL implicitly quantifies over only a single path at a time, hence cannot express many hyperproperties of interest.
- In LTL the satisfying object is a trace. Syntax:

$$\varphi ::= a \qquad | \neg \varphi \quad | \varphi \lor \varphi \quad | \quad \mathbf{X} \varphi \quad | \varphi \lor \varphi$$

In HyperLTL the satisfying object is a set of traces and a trace assignment:

$$\begin{aligned} \psi &::= & \exists \pi. \ \psi \mid \quad \forall \pi. \ \psi \mid \quad \varphi \\ \varphi &::= & a_{\pi} \quad \mid \quad \neg \varphi \quad \mid \quad \varphi \lor \varphi \quad \mid \quad \mathbf{X} \varphi \quad \mid \quad \varphi \lor \varphi \end{aligned}$$

Syntax

Formulas of HyperLTL are defined by the following grammar:

 π is a trace variable from an infinite supply \mathcal{V} of trace variables.

 $\forall \pi_1. \forall \pi_2. \exists \pi_3. \psi$ means that for all traces π_1 and π_2 , there exists another trace π_3 , such that ψ holds on those three traces.

 X_{φ} means that φ holds on the next state of every quantified trace.

UiO : University of Oslo

Syntax

- Implication: $\varphi_1 \rightarrow \varphi_2 \equiv \neg \varphi_1 \lor \varphi_2$
- Conjunction: $\varphi_1 \land \varphi_2 \equiv \neg (\neg \varphi_1 \lor \neg \varphi_2)$
- Bi-implication: $\varphi_1 \leftrightarrow \varphi_2 \equiv (\varphi_1 \rightarrow \varphi_2) \land (\varphi_2 \rightarrow \varphi_1)$
- True and false: $a_{\pi} \lor \neg a_{\pi}$ and $\neg true$
- Other standard temporal connectives are:
 - $F\varphi \equiv true \ U \varphi$
 - $\quad G\varphi \equiv \neg F \neg \varphi$
 - $\hspace{0.2cm} \varphi_1 \hspace{0.1cm} W \hspace{0.1cm} \varphi_2 \equiv \hspace{0.2cm} (\varphi_1 \hspace{0.1cm} U \varphi_2) \hspace{0.1cm} \vee \hspace{0.1cm} G \hspace{0.1cm} \varphi_1$
 - $\varphi_1 R \varphi_2 \equiv \neg (\neg \varphi_1 U \neg \varphi_2)$
- $\varphi_1 \cup \varphi_2$ means that φ_2 will eventually hold of the states of all quantified traces that appear at the same index, and until then φ_1 holds.

Semantics

Validity:

- $$\begin{split} \Pi &\models_{T} \exists \pi. \psi & \text{iff there exists } t \in T : \Pi[\pi \mapsto t] \models_{T} \psi \\ \Pi &\models_{T} \forall \pi. \psi & \text{iff for all } t \in T : \Pi[\pi \mapsto t] \models_{T} \psi \\ \Pi &\models_{T} a_{\pi} & \text{iff } a \in \Pi(\pi)[0] \\ \Pi &\models_{T} \neg \varphi & \text{iff } \Pi \not\models_{T} \varphi \\ \Pi &\models_{T} \varphi_{1} \lor \varphi_{2} & \text{iff } \Pi \models_{T} \varphi_{1} \text{ or } \Pi \models_{T} \varphi_{2} \\ \Pi &\models_{T} X \varphi & \text{iff } \Pi[1, \infty] \models_{T} \varphi \\ \Pi &\models_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &\models_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &\models_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \models_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exists } i \geq 0 : \Pi[i, \infty] \mapsto_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exist } i \geq 0 : \Pi[i, \infty] \mapsto_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exist } i \geq 0 : \Pi[i, \infty] \mapsto_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exist } i \geq 0 : \Pi[i, \infty] \mapsto_{T} \varphi_{2} \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exist } i \geq 0 \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exist } i \geq 0 \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exist } i \geq 0 \\ u &=_{T} \varphi_{1} \cup \varphi_{2} & \text{iff there exist } i \geq 0 \\ u &=_{T} \varphi_{1} \oplus_{T} \varphi_{2} & \text{iff there exist } i \geq 0 \\ u &=_{T} \varphi_{1} \oplus_{$$
- Trace assignment suffix $\Pi[i, \infty]$ denotes the trace assignment below for all π $\Pi'(\pi) = \Pi(\pi)[i, \infty]$
- If $\Pi \models_T \varphi$ holds for the empty assignment Π , then T satisfies φ .

UiO : University of Oslo

Semantics

- A Kripke structure *K* is a tuple (S, s_0, δ, AP, L)
 - a set of states S,
 - an initial state $s_0 \in S$,
 - a transition function δ
 - $S \rightarrow 2^S$, a set of atomic propositions AP
 - a labeling function $L : S \rightarrow 2^{AP}$.
- To ensure that all traces are infinite, we require that $\delta(s)$ is nonempty for every state s.
- The set Traces (*K*) of traces of *K* is the set of all sequences of labels produced by the state transitions of *K* starting from initial state.
- Traces (*K*) contains trace *t* iff there exists a sequence $s_0s_1...$ of states, such that s_0 is the initial state, and for all $i \ge 0$, it holds that $s_i + 1 \in \delta(s_i)$; and $t[i] = L(s_i)$.
- A Kripke structure K satisfies φ , denoted by $K \models \varphi$, if Traces (K) satisfies φ .

Security Policies in HyperLTL

- Noninterference: the outputs observed by low-security users are the same as they would be in the absence of inputs submitted by high-security users.
- Noninference is a variant of noninterference.
- Noninference: for all traces, the low-observable behavior must not change when all high inputs are replaced by a dummy input λ , that is, when the high input is removed.

Noninference in HyperLTL:

$$\forall \pi. \exists \pi'. (G \lambda_{\pi'}) \land \pi =_L \pi'$$

 $\lambda_{\pi'}$ expresses that all of the high inputs in the current state of π' are λ , $\pi =_L \pi'$ expresses that all low variables in π and π' have the same values.

Security Policies in HyperLTL

 A (nondeterministic) program satisfies observational determinism if every pair of traces with the same initial low observation remain indistinguishable for low users.

Observational determinism in HyperLTL:

$$\forall \pi. \forall \pi'. \pi[0] =_{L,in} \pi'[0] \rightarrow \pi =_{L,out} \pi'$$

Where $\pi =_{L,in} \pi'$ and $\pi =_{L,out} \pi'$ express that both traces agree on the low input and low output variables, respectively.

Problems about HyperLTL:

Bounded termination is not expressible.

Satisfiability problem is undecidable.
