

Chapter 5

Partial-order reduction

Course “Model checking”
Volker Stolz, Martin Steffen
Autumn 2019

Chapter 5

Learning Targets of Chapter “Partial-order reduction”.

The chapter gives an introduction to *partial order reduction*, an important optimization technique to avoid or at least mitigate the state-space explosion problem.

Chapter 5

Outline of Chapter “Partial-order reduction”.

Introduction

Independence and invisibility

Introduction

Chapter 5 “Partial-order reduction”

Course “Model checking”

Volker Stolz, Martin Steffen

Autumn 2019

State space explosion problem

- MC in general “intractable”
- fundamental limitation: combinatorial
- state space: exponential in problem size
 - in particular in *number of processes*

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

Battling the state space explosion

- symbolic techniques,
- BDDs
- abstraction
- compositional approaches
- symmetry reduction
- special data representations
- “compiler optimizations”: slicing, live variable analysis
- . . .
- here: *partial order reduction*

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

“Asynchronous” systems and interleaving

IN5110 –
Verification and
specification of
parallel systems

- remember: synchronous and asynchronous product (in connection with LTL model checking)
- asynchronous: software and asynchronous HW
- synchronous: often HW, global clock
- **interleaving** (of steps, actions, transitions ...)

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

Where does the name come from?

- partial-order semantics
- what is *concurrent* execution (or parallel)
- “causal” order
- “*true*” concurrency vs. *interleaving* semantics
- “math” fact: PO equivalent set of all linearizations
- “reality” fact: POR not always based on that math-fact
- perhaps better name for POR: “COR”:

commutativity-based reduction

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

Basic idea

- important case of a general approach

Exploiting “equivalences”

Instead of checking all “situations”,

- figure which are **equivalent** (also wrt. to the property)
 - check only one (or at least not all) **representatives** per equivalence class
-
- see also *symmetry reduction*
 - 8 queens problem
 - POR: equivalent *behaviors*

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

(Labelled) transition systems

- basically unchanged,
 - assume initial states
 - states labelled with sets 2^{AP}
 - state-labelling function L
 - transitions are as well
- alternatively multiple transition relations: instead of $\xrightarrow{\alpha}$, we also see α as relation

$$(S, S_0, \rightarrow, L)$$

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

Determinism and enabledness

IN5110 –
Verification and
specification of
parallel systems

- remember: $\xrightarrow{\alpha}$ **deterministic**
- in that case: also write $s' = \alpha(s)$ for $s \xrightarrow{\alpha} s'$ (or $\alpha(s, s')$)

Enabledness

$\xrightarrow{\alpha}$ **enabled** in s , if $s \xrightarrow{\alpha}$

Otherwise $\xrightarrow{\alpha}$ *disabled* in s .

- path π :

$$s_0 \xrightarrow{\alpha_0} s_1 \xrightarrow{\alpha_1} s_2 \xrightarrow{\alpha_2} \dots$$

- not necessarily infinite

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

Concurrency in asynchronous systems

- independent transitions
- arbitrary orderings or linearizations (= interleavings)
- [actions themselves assumed atomic / indivisible]

- raw math calculation: n transition relations
 - $n!$ different orderings
 - 2^n states

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

Reducing the state space

- goal: **pruning** the state space

Super-unrealistic:

1. generate explicitly the state space by DFS
2. then prune it (remove equivalent transitions & states)
3. then model check the property

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

Reducing the state space

- goal: **pruning** the state space

unrealistic (but for presentation reasons)

1. generate explicitly the reduced state space (using modified DFS)
2. then model check the property

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

Modified DFS: ample set

- standard DFS: basically *recursion* (probably with explicit stack)
- exploration: explore “successor states”, i.e.,

follow **all enabled** transitions

- graph exploration (not tree): check for *revisits*

- ample: think “sufficient” or “enough”
- **ample** set of transitions in a state \subseteq set of enabled transitions in a state

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

Modified DFS: ample set

- standard DFS: basically *recursion* (probably with explicit stack)
- exploration: explore “successor states”, i.e.,
follow **all enabled** transitions
- graph exploration (not tree): check for *revisits*

Modification/improvement

Don't explore *all* enabled transitions.

follow **enough enabled** transition

- ample: think “sufficient” or “enough”
- **ample** set of transitions in a state \subseteq set of enabled transitions in a state

Modified DFS

```
1  hash(s0);
2  set on_stack(s0);
3  expand_state(s0);

4  procedure expand_state(s)
5      work_set(s) := ample(s);
6      while work_set(s) is not empty do
7          let  $\alpha \in work\_set(s)$ ;
8          work_set(s) := work_set(s) \ { $\alpha$ };
9          s' :=  $\alpha(s)$ ;
10         if new(s') then
11             hash(s');
12             set on_stack(s');
13             expand_state(s');
14         end if;
15         create_edge(s,  $\alpha$ , s');
16     end while;
17     set completed(s);
18 end procedure
```

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

General requirements on *ample*

1. pruning with ample does not change the outcome of the MC run (**correctness**)
 2. pruning should, however, cut out a *significant* amount
 3. calculating the ample set: not too much *overhead*
- so far:
 - quite wishy-washy, only general idea
 - “unrealistic” (as mentioned)
 - details also dependent on the “programming language”
 - alternatives of *ample sets* with analogous ideas (the names are not really indicative of how all that works):
 - sleep sets
 - persistent sets
 - stubborn sets
 - ...

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

With a little help of the programmer ...

- for instance: Spin
- Spin: early adoptor of POR
- reduce the amount of interleavings

atomic	D_step
atomic block executed indivisibly	deterministic code fragment executed indivisibly.

- `D_step` more strict than `atomic` (eg. wrt. `goto` statements)

Independence and invisibility

Chapter 5 “Partial-order reduction”

Course “Model checking”

Volker Stolz, Martin Steffen

Autumn 2019

2 relations between relations

- we have labelled transitions (resp. multiple relations)
- 2 important conditions for POR
 - one connects *two relations*
 - one connects one relation with the property to verify

Independence

roughly: the order of 2 independent transitions does not matter.

Invisible

Taking a transition does not change the satisfaction of relevant formulas

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

Determinism, confluence, and commuting diamond property

IN5110 –
Verification and
specification of
parallel systems

Determinism

Diamond prop.

Comm. d-prop.

“Swapping” or commuting

and vice versa

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL

Calculating the ample sets

Independence

- assume: transition relations $\xrightarrow{\alpha_i}$ *deterministic*
- write $\alpha_i(s)$ for $s \xrightarrow{\alpha_i}$

Definition (Independence)

An *independence relation* $I \subseteq \rightarrow \times \rightarrow$ is a symmetric, antireflexive relation such that the following holds, for all states $s \in S$ and all $(\xrightarrow{\alpha_1}, \xrightarrow{\alpha_2}) \in I$

Enabledness If $\alpha_1, \alpha_2 \in \text{enabled}(s)$, then
 $\alpha_1 \in \text{enabled}(\alpha_2(s))$

Commutativity: if $\alpha_1, \alpha_2 \in \text{enabled}(s)$, then

$$\alpha_1(\alpha_2(s)) = \alpha_2(\alpha_1(s))$$

- *dependence relation:* $D = (\rightarrow \times \rightarrow) \setminus I$

parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL

Calculating the ample sets

Is that all?

2 issues

1. The checked **property** might be sensitive to the choice between s_1 and s_2 (and not just depend on s and r)
2. s_1 and s_2 may have **other successors** not shown in the diagram.

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

- $L : S \rightarrow 2^{AP}$
- $\xrightarrow{\alpha}$ is **invisible** wrt. to a set of $AP' \subseteq AP$ if for all $s_1 \xrightarrow{\alpha} s_2$

$$L(s_1) \cap AP' = L(s_2) \cap AP'$$

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL

Calculating the ample sets

Blocks and stuttering

stuttering equivalent paths

- **block**: finite sequence of intentially labelled states
- stuttering (in this form): important for *asynchronous* systems

Stutter invariance

An LTL formula φ is *invariant under stuttering* iff for all pairs of paths π_1 and π_2 with $\pi_1 \sim_{st} \pi_2$,

$$\pi_1 \models \varphi \quad \text{iff} \quad \pi_2 \models \varphi$$

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

- \bigcirc breaks stutter invariance
- LTL_{\bigcirc} : “next-free” fragment of LTL (often also $LTL_{\neg X}$)

Theorem (Stuttering)

- *Any LTL_{\bigcirc} property is invariant under stuttering*
- *Any LTL property which is invariant under stuttering is expressible in LTL_{\bigcirc}*

POR for LTL_○

Calculating the ample sets

Chapter 5 “Partial-order reduction”

Course “Model checking”

Volker Stolz, Martin Steffen

Autumn 2019

POR for LTL_○

- general useful and fruitful setting for POR
- of course: one may look more specific for specific formulas
- in that setting:

Correctness of POR

Ample sets prune the (DFS) search. **Goal:**

$$\mathcal{M}, s \models \varphi \quad \text{iff} \quad \mathcal{M}^{\>\circ}, s \models \varphi$$

- note: “iff”
- mainly a condition on *paths*

Path representatives

each path π_1 in \mathcal{M} starting in s is represented by an **equivalent** path π_2 in $\mathcal{M}^{\>\circ}$, starting in s

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL_○

Calculating the ample sets

4 conditions for selecting ample set

- each pruned path can be “reordered” to an which is explored (using **independence**). include a condition covering end-states
- make sure that the reordering (pre-poning) does not change the logical status (**stutting, visibility**)
- “fairness”: make use not to prune “relevant” transitions by letting the search **cycle** in irrelevant ones.

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL

Calculating the ample sets

Reordering conditions (C_0 , C_1)

IN5110 –
Verification and
specification of
parallel systems

C_0 : stop at a dead end, only

$$ample(s) = \emptyset \text{ iff } enabled(s) = \emptyset$$

C_1

Along every path in \mathcal{M} starting at s , the following condition holds: a transition **dependent** on a transition in $ample(s)$ cannot be executed without a transition from $ample(s)$ occurring *first*.

- easy fact: $ample(s) \bowtie \neg ample(s)$

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL $_ \bigcirc$
Calculating the ample sets

Form of paths in \mathcal{M}^{sc}

- consequence of \mathbf{C}_1 : two forms of paths

with prefix $\beta_0\beta_1\dots\beta_m\alpha$

- $\alpha \in \text{ample}(s)$
- $\beta_i \bowtie \text{ample}(s)$
- assume: all $\beta_i \notin \text{ample}(s)$
- same as $\beta_i \in \neg\text{ample}(s)$?

without such prefix:

- infinite $\beta_0\beta_1\beta_2\dots$
- $\beta_i \bowtie \text{ample}(s)$

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL \bigcirc
Calculating the ample sets

Commutation

path $\vec{\beta}\alpha$ in \mathcal{M} , starting in s

- $\alpha \in \text{ample}(s)$, $\beta_i \notin \text{ample}(s)$

- $\pi_1 = \vec{\beta}\alpha$
- $\pi_2 = \alpha\vec{\beta}$

- $\pi_1 \in \mathcal{M}$ implies $\pi_2 \in \mathcal{M}$ (and vice versa)
- what about \mathcal{M}° ?: $\pi_1 \notin \mathcal{M}^{\circ}$ ($m > 0$) and $\pi_2 \in \mathcal{M}^{\circ}$

Explanations

The assumptions of *independence* means that, in the original transition system \mathcal{M} the following holds: if (starting in s)

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL

Calculating the ample sets

- π_1 and π_2 (and intermediate mixtures): “interchangable”
- start and end point equal
- but: does it matter which one is taken
 - wrt. the logical **property**, i.e.,
 - does it matter which **intermediate states** are visited?

$$s_i \xrightarrow{\alpha} r_i$$

Invisibility of transitions

IN5110 –
Verification and
specification of
parallel systems

- remember: **invisibility** if transitions (by sets of atomic propositions)

C₂ (invisibility)

If s is not fully expanded, then every $\alpha \in \text{ample}(s)$ is *invisible*.

POR for LTL

Calculating the ample sets

Remember the 2 issues

1. satisfaction depends in choosing path via s_1 or s_2 ?
2. forgotten successors?

- assume: s_1 is omitted ($\beta \in ample(s)$, but not α)

issue 2

the conditions imply

1. $ss_2r \sim_{st} ss_1r$
2. $ss_1s_1' \sim_{st} ss_2r r'$

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL
Calculating the ample sets

Complexity

- checking conditions on-the-fly
- C_0 : easy
- C_1 : tricky
 - refers to \mathcal{M} , not $\mathcal{M}^{\times\infty}$
 - checking C_1 : equivalent to reachability checking
- strengthen C_3 :

sufficient for C_3

- at least one state along each cycle must be fully expanded
- since we do DFS: watch out for “back edges”: C'_3 : If s is not fully expanded, then no transition in $ample(s)$ may reach a state that is on the search *stack*

General remarks on heuristics

- dependence and independence \bowtie “theoretical” relation between (deterministic) relations
- “use case”: capturing steps of concurrent programs
 - processes with program counter (control points)
 - different ways of
 - synchronization
 - sharing memory
 - communication
- calculating (approx. of) ample sets: dependent on the programming model

Calculating the ample sets

Notions, notations, definitions

IN5110 –
Verification and
specification of
parallel systems

Targets & Outline

Introduction

Independence and
invisibility

POR for LTL

Calculating the ample sets

- we write now α for $\xrightarrow{\alpha}$
- fixed, finite set of processes i (called P_i)
- T_i : those transitions that “belong to” P_i
- some more easy definitions
 - $pc_i(s)$: value of program counter of i in state s
 - $pre(\alpha)$:
 - transition whose execution *may* enable α
 - can be over-approximative
 - $dep(\alpha)$: transitions interdependent with α
 - $current_i(s)$
 - $T_i(s)$

When are transitions (inter)dependent

- note: dependence is *symmetric*! (good terminology?)

Shared variables

pairs of transitions, that *share* a variables which is changed (or written?) by at least one of them

Same process

pairs of transitions belonging to the *same process* are interdependent. In particular $current_i(s)$

Message passing

- 2 sends to the same channel or message queue
- 2 receives from the same channel
- **Note** send and receive independent (also on the same channel).
- side remark: rendezvous is seen/ can be seen a joint step of 2 processes

Introduction

Independence and
invisibility

POR for LTL

Calculating the ample sets

Transitions that may enable α ($pre\alpha$)

IN5110 –
Verification and
specification of
parallel systems

$$pre(\alpha) \supseteq \{\beta \mid \alpha \notin enabled(s), \beta \in enabled(s), \alpha \in enabled(\beta(s))\}$$

- assume α is an action from P_i
- $pre(\alpha)$ includes
 - “local predecessor” of i (“program order”)
 - **shared variables**: if enabling conditions of α involves shared variables: the set contains *all other transitions* that can change these shared variables
 - **message passing**: if α is a send (reps. receive), the $pre(\alpha)$ contains transitions of other processes that receive (resp. send) on the channel
