$$\begin{aligned} S &\rightarrow T \\ T &\rightarrow TaTaTbT|TaTbTaT|TbTaTaT|\lambda \end{aligned}$$

Let  $A$  be the language containing twice as many a's as b's.

As every rule either adds two a's and a b or nothing, all strings derived from the grammar must be in  $A$ .

Let  $s$  be a string in  $A$ . Since every non-terminal symbol can be replaced by  $\lambda$ , one can always replace two a's and a b in  $A$  with a  $T$ . The resulting string, sans the  $T$ , will still be in  $A$ . Once only one b and two a's remain, substitute with  $S$ . This means  $s$  can be derived from  $S$ , and the proof is complete.
