Normal forms Introduction

Introduction

- ▶ SAT is the problem of determining if a propositional formula (on conjunctive normal form) is satisfiable.
- ▶ The DPLL (Davis-Putnam-Logemann-Loveland) procedure from 1962 [2] is an algorithm solving SAT.
- ▶ DPLL is a refinement of the DP (Davis-Putnam) procedure from 1960 [3].
- ▶ We present (a version of) DPLL as a calculus.
- ▶ DPLL is interesting because it works well in practice, ie. the best SAT solvers are based on DPLL.

Normal forms

Espen H. Lian (Ifi, UiO)

SAT and DPLL

May 4, 2010

2 / 59

Normal forms Normal forms

Preliminaries

A literal is a propositional variable or its negation.

Our connectives are \neg , \wedge , \vee and \supset .

 \top and \bot are the truth constants.

We will use the following notation.

- propositional variables: P, Q, R, S (possibly subscripted)
- ▶ literals: x, y, z (possibly subscripted)
- \triangleright general formulae: X, Y, Z

The complement of a literal is defined as follows.

- $ightharpoonup \overline{P} = \neg P$, and
- $\overline{\neg P} = P$.

Espen H. Lian (Ifi, UiO) SAT and DPLL May 4, 2010 3 / 59 Espen H. Lian (Ifi, UiO) SAT and DPLL May 4, 2010

NNF

A formula is on negation normal form (NNF) if negations occur only in front of propositional variables and implications does not occur at all.

Any formula can be put on NNF using the following rewrite rules.

$$\neg \neg X \to X$$

$$X \supset Y \to \neg X \lor Y$$

$$\neg (X \land Y) \to \neg X \lor \neg Y$$

$$\neg (X \lor Y) \to \neg X \land \neg Y$$

Some additional rewrite rules are needed for formula containing \top and \bot .

We will assume that a formula X on NNF does not contain \top or \bot unless $X = \top$ or $X = \bot$.

Espen H. Lian (Ifi, UiO)

SAT and DPLL

May 4, 2010

5 / 59

Normal forms Normal forms

Example

The following formula expresses " $P \land Q$ or $R \land S$ but not both." (ie. exclusive or).

$$((P \land Q) \lor (R \land S)) \land (\neg(P \land Q) \lor \neg(R \land S))$$

NNF:
$$((P \land Q) \lor (R \land S)) \land ((\neg P \lor \neg Q) \lor (\neg R \lor \neg S))$$

CNF:
$$(P \lor R) \land (P \lor S) \land (Q \lor R) \land (Q \lor S) \land (\neg P \lor \neg Q \lor \neg R \lor \neg S)$$

The NNF to CNF part is performed as follows.

$$(P \land Q) \lor (R \land S)$$

$$\rightarrow (P \lor (R \land S)) \land (Q \lor (R \land S))$$

$$\rightarrow (P \lor R) \land (P \lor S) \land (Q \lor (R \land S))$$

$$\rightarrow (P \lor R) \land (P \lor S) \land (Q \lor R) \land (Q \lor S)$$

CNF and DNF

A formula is on conjunctive normal form (CNF) if it is a conjunction of disjunctions of literals.

Example 1

$$(\neg P \lor Q) \land (P \lor \neg Q \lor R) \land (Q \lor S) \land (P \lor \neg R)$$

A formula on NNF can be put on CNF using the following rewrite rules.

$$(X \land Y) \lor Z \to (X \lor Z) \land (Y \lor Z)$$
$$Z \lor (X \land Y) \to (Z \lor X) \land (Z \lor Y)$$

A formula is on disjunctive normal form (DNF) if it is a disjunction of conjunctions of literals.

DNF is like CNF, only with \land and \lor exchanged.

Espen H. Lian (Ifi, UiO)

SAT and DPLL

May 4, 2010

6 / 59

Normal forms Normal forms

Size increase

Rewriting a formula from DNF to CNF (or vice versa) may cause an exponential increase in size.

$$(P_1 \wedge P_2) \vee (P_3 \wedge P_4) \vee (P_5 \wedge P_6)$$

On CNF:

$$(P_1 \lor P_3 \lor P_5) \land (P_1 \lor P_3 \lor P_6) \land$$

$$(P_1 \lor P_4 \lor P_5) \land (P_1 \lor P_4 \lor P_6) \land$$

$$(P_2 \lor P_3 \lor P_5) \land (P_2 \lor P_3 \lor P_6) \land$$

$$(P_2 \lor P_4 \lor P_5) \land (P_2 \lor P_4 \lor P_6)$$

Espen H. Lian (Ifi, UiO) SAT and DPLL May 4, 2010 Espen H. Lian (Ifi, UiO) SAT and DPLL 7 / 59 May 4, 2010 8 / 59

Clauses and clause sets

For the sake of notational simplicity, instead of using formula on CNF, we will use *clause sets*.

A clause is a disjunction of literals.

A unit clause is a singleton clause.

A clause set is a finite set of clauses (interpreted conjunctively).

We will represent non-empty clauses by the set of its literals using a Prolog-like notation.

- ▶ An empty clause is the empty disjunction \bot .
- ▶ $x_1 \lor \cdots \lor x_n$ is represented by the set $[x_1 \ldots x_n]$, for n > 0 (n is the length).
- ▶ We will sometimes write [] for \bot .

Observe that $[] \neq \emptyset$ (see next foil).

Espen H. Lian (Ifi, UiO)

SAT and DPLL

May 4, 2010

9 / 59

Normal forms Clauses and clause sets

Valuation

Let Γ be a clause set and C a clause.

As clauses are disjunctions, it follows that they are valuated as follows.

$$v(C) = 1$$
 iff $v(x) = 1$ for some $x \in C$.

We will interpret clause sets conjunctively, ie.

$$v(\Gamma) = 1$$
 iff $v(C) = 1$ for every $C \in \Gamma$.

Observe that

- ▶ if C is empty, then v(C) = 0, while
- ▶ if Γ is empty, then $\nu(\Gamma) = 1$.

Thus we may use clause sets to represent formula on CNF.

Example:

$$v(\{[P \neg Q R], [\neg P \neg R]\}) = v((P \lor \neg Q \lor R) \land (\neg P \lor \neg R))$$

Example

Some clauses:

- 1. $[P \neg Q R]$
- 2. $[P \neg P]$
- 3. [], the empty clause

Some clause sets:

- 1. $\{[P \neg Q R]\}$
- 2. $\{[P \neg P], [], [P \neg Q R]\}$
- 3. \emptyset , the empty clause set
- 4. {[]}, the clause set containing exactly the empty clause

Normal forms Clauses and clause sets

Subsumption

Let C_1 and C_2 be clauses. If $C_1 \subseteq C_2$, we say that C_1 subsumes C_2 .

Lemma 2 (Subsumption)

If C_1 subsumes C_2 , and $v(C_1) = 1$, then $v(C_2) = 1$.

Proof.

- ▶ If $v(C_1) = 1$, then v(x) = 1 for some $x \in C_1$.
- ▶ If $C_1 \subseteq C_2$, then $x \in C_2$.
- ▶ Thus $v(C_2) = 1$.

Example: $\models P \supset (P \lor Q)$ as [P] subsumes [P Q].

Espen H. Lian (Ifi, UiO) SAT and DPLL May 4, 2010 11 / 59 Espen H. Lian (Ifi, UiO) SAT and DPLL May 4, 2010 12 / 59

Subsumption

Define $\Gamma_x = \{C \cup [x] \mid C \in \Gamma\}$, ie. x is added to every clause.

Example

- 1. $\{[PQ], [\neg Q], [\neg P \neg Q]\}_x = \{[PQx], [\neg Qx], [\neg P \neg Qx]\}_x$
- 2. $\{[P \ Q], [\neg Q], [\neg P \ \neg Q]\}_P = \{[P \ Q], [P \ \neg Q], [P \ \neg P \ \neg Q]\}.$
- 3. $\{\bot\}_x = \{[]\}_x = \{[x]\}.$
- 4. $\emptyset_{\mathsf{x}} = \emptyset$.

Corollary 3 (of the Subsumption Lemma)

If $v(\Gamma) = 1$, then $v(\Gamma_x) = 1$.

Proof.

Every clause in Γ subsumes one in Γ_x .

П

Some lemmata

Let Γ and Δ be clause sets and C a clause.

- ightharpoonup Γ , Δ means $\Gamma \cup \Delta$.
- ightharpoonup Γ , C means $\Gamma \cup \{C\}$.
- ▶ We say that x occurs in Γ if $x \in C$ for some $C \in \Gamma$.

Lemma 5

Let Γ be a non-empty clause set without any occurrence of x or \overline{x} . If Γ is satisfiable, there is some valuation v such that $v(\Gamma, [x]) = 1$.

Subsumption

A similar lemma for clause sets, only the other way as clause sets are interpreted conjunctively and clauses disjunctively.

Lemma 4

Let Γ and Δ be clause sets. If $\Delta \subseteq \Gamma$ and $v(\Gamma) = 1$, then $v(\Delta) = 1$.

Proof.

- ▶ If $v(\Gamma) = 1$, then v(C) = 1 for every $C \in \Gamma$.
- ▶ If $\Delta \subset \Gamma$, then $\nu(C) = 1$ for every $C \in \Delta$.
- ▶ Thus $v(\Delta) = 1$.

Espen H. Lian (Ifi, UiO)

DPLL

The core of DPLL

The preceding lemma comes close to the core of DPLL.

If we make x true, we can

- 1. remove every clause containing x, and
- 2. remove \overline{x} from every clause containing it.

Example 7

Let $\Gamma = \{ [P \ Q], [\neg P \ \neg Q], [Q \ \neg R] \}.$

If v(P) = 1, then we can

- 1. remove [P Q], and
- 2. remove $\neg P$ from $[\neg P \neg Q]$.

In other words, $v(\Gamma) = v(\{ [\neg Q], [Q \neg R] \}).$

Espen H. Lian (Ifi, UiO)

SAT and DPLL

May 4, 2010

17 / 59

DPLL Preliminaries

Preliminaries

The DPLL calculus operates not on general formulae but on a clause set Γ .

We start by removing from Γ

▶ any clause C such that $\{x, \overline{x}\} \subseteq C$ for some x.

This obviously does not affect satisfiability.

▶ If $\{x, \overline{x}\} \subseteq C$, then v(C) = 1, thus $v(\Gamma) = v(\Gamma \setminus \{C\})$.

DPLL The rules

The rules

Let Γ , Λ and Δ be clause sets without any occurrence of x or \overline{x} such that Γ and Λ are non-empty.

Definition 8

An axiom is any clause set where the empty clause occurs, ie. of the form \bot, Δ .

Why are the axioms unsatisfiable?

- ▶ In terms of sequent calculus, that Γ is satisfiable may be expressed as $\Gamma \not\vdash \bot$ or $\Gamma \not\vdash \emptyset$.
- ▶ DPLL can be viewed as a left-calculus, ie. the right hand side of the sequent is empty.
- ▶ Thus in sequent calculus terms, \bot , Δ means \bot , $\Delta \vdash \bot$, which is valid.

Espen H. Lian (Ifi, UiO) SAT and DPLL May 4, 2010 19 / 59 Espen H. Lian (Ifi, UiO) SAT and DPLL May 4, 2010 20 / 59

Monotone literal fixing

If it's the case that some x occurs in some clauses and \bar{x} does not, we say that x is monotone, and we make x true, because this makes the clauses x occurs in true and does not affect the other clauses.

$$\frac{\Delta}{\Gamma_x,\Delta}$$
 Mon

This rule is sometimes called the Affirmative-Negative Rule.

Example: $\neg Q$ is monotone.

$$\frac{[P \neg Q R], [\neg P \neg R], [P \neg R]}{[P \neg Q R], [\neg P \neg R], [P \neg R]} \text{ Mon}$$

DPLL The rules

Unit resolution

If it's the case that

- ▶ the unit clause [x] occurs,
- ▶ x does not occur anywhere else but
- $ightharpoonup \overline{x}$ does,

make x true.

$$\frac{\Lambda,\Delta}{[x],\Lambda_{\overline{x}},\Delta}$$
 Res

Example:

$$\frac{[Q], [P \neg Q], [\neg P \neg Q], [R]}{[Q], [P \neg Q], [\neg P \neg Q], [R]} \operatorname{Res}$$

Unit subsumption

If it's the case that

- ▶ the unit clause [x] occurs,
- x occur in some other clauses, and
- $ightharpoonup \overline{x}$ occurs in yet others,

[x] subsumes the others where x occurs.

$$\frac{[x], \Lambda_{\overline{x}}, \Delta}{[x], \Gamma_x, \Lambda_{\overline{x}}, \Delta}$$
 Sub

Example: [Q] subsumes $[\neg P \ Q]$.

$$\frac{[Q], [\neg P \ Q], [\neg P \ \neg Q], [R]}{[Q], [\neg P \ Q], [\neg P \ \neg Q], [R]}$$
Sub

Complexity NP-completeness

NP-completeness

The first problem to be proven NP-complete was SAT.

Theorem 16 (Cook's Theorem)

SAT is NP-complete.

Proof.

Non-trivial. See [1] or [8].

We know from the previous lecture (in 2008 at least) that propositional satisfiablity is NP-complete.

- ▶ NP-hardness: follows directly from Cook's Theorem.
- ▶ NP-membership: a non-deterministic machine can guess a satisfying valuation and verify it in polynomial time.

Espen H. Lian (Ifi, UiO) SAT and DPLL May 4, 2010 35 / 59 Espen H. Lian (Ifi, UiO) SAT and DPLL May 4, 2010 36 / 59

Size

A problem (instance) is an instance of SAT, ie. a clause set. If

- \triangleright the number of clauses is n,
- ▶ there occurs *m* distinct propositional variables, and
- every clause is of length $\leq c$,

the problem size is represented by the triple

$$n \times m \times c$$
.

Example. The following problem has size $2 \times 4 \times 3$.

$$\{[P \neg Q R], [Q R \neg S]\}$$

Espen H. Lian (Ifi, UiO)

SAT and DPLL

May 4, 2010

37 / 59

Complexity Equivalence

Equivalence

► Two formulae X and Y are equivalent if

$$v(X) = v(Y)$$
 for every valuation v.

- ▶ Equivalence can be expressed in our logical language.
 - ▶ Let $(X \equiv Y)$ denote $(X \supset Y) \land (Y \supset X)$.
- ▶ So far we have reduced a formula to an equivalent one on CNF:
 - $X \to Y$, where
 - ▶ X and Y are equivalent, and
 - Y is on CNF.
- ▶ This, in fact, is not strictly necessary.

Reduction to CNF

As mentioned, reducing a propositional formula to CNF can cause exponential increase in size.

A formula of the form $(x_1 \wedge y_1) \vee \cdots \vee (x_n \wedge y_n)$ reduced to CNF has size

$$2^n \times 2n \times n$$
,

that is 2^n clauses of length n.

Example 17

If n = 3, we get a $8 \times 6 \times 3$ problem:

$$(x_1 \lor x_2 \lor x_3) \land (x_1 \lor x_2 \lor y_3) \land (x_1 \lor x_3 \lor y_2) \land (x_1 \lor y_2 \lor y_3) \land (x_2 \lor x_3 \lor y_1) \land (x_2 \lor y_1 \lor y_3) \land (x_3 \lor y_1 \lor y_2) \land (y_1 \lor y_2 \lor y_3)$$

But the reason for using DPLL in the first place is effectivity!

Tseitin encoding

Problem given an arbitrary formula on NNF, find an equisatisfiable formula on CNF (or the corresponding clause set).

Solution Represent each subformulae (except for literals) with a propositional variable, recursively.

Usually attributed to Tseitin [9].

Example 18

 $((P \land \neg Q) \lor R)$ has two non-literal subformulae, one of which is itself.

$$\underbrace{(P \land \neg Q) \lor R}_{P_2} \lor R$$

Espen H. Lian (Ifi, UiO)

SAT and DPLL

May 4, 2010

41 / 59

Complexity Tseitin encoding

Tseitin encoding

- ▶ In fact $\models \varphi \supset ((P \land \neg Q) \lor R)$.
- If $v(\varphi) = 1$, then v makes the three conjuncts true:
 - 1. $v(P_1) = 1$
 - 2. $v(P_1 \equiv (P_2 \vee R)) = 1$
 - ▶ Thus $v(P_1) = v(P_2 \vee R) = 1$.
 - ▶ Thus $v(P_2) = 1$ or v(R) = 1.
 - 3. $v(P_2 \equiv (P \land \neg Q)) = 1$
 - ▶ Thus $v(P_2) = v(P \land \neg Q)$.
 - If $v(P_2) = 1$, then $v(P \land \neg Q) = 1$.
- ▶ Hence $v((P \land \neg Q) \lor R) = 1$.
- ▶ Observe that $\not\models ((P \land \neg Q) \lor R) \supset \varphi$.

Tseitin encoding

- ▶ For each new variable P_k , we generate a formula expressing that P_k is equivalent to the formula it represents:
 - $(P_1 \equiv (P_2 \vee R))$
 - $(P_2 \equiv (P \land \neg Q))$
- ▶ In addition we want the variable expressing the entire formula, in our case P_1 to be true.
- Let φ denote the following conjunction.

$$P_1 \land (P_1 \equiv (P_2 \lor R)) \land (P_2 \equiv (P \land \neg Q))$$

▶ Then φ is equisatisfiable to $((P \land \neg Q) \lor R)$.

Complexity Tseitin encoding

Tseitin encoding

In order to convert φ to CNF, we use the following functions.

$$\langle x \wedge y \rangle^{P} = \{ [\neg P \ x], [\neg P \ y], [P \ \overline{x} \ \overline{y}] \}$$
$$\langle x \vee y \rangle^{P} = \{ [P \ \overline{x}], [P \ \overline{y}], [\neg P \ x \ y] \}$$
$$\langle x \supset y \rangle^{P} = \{ [P \ x], [P \ \overline{y}], [\neg P \ \overline{x} \ y] \}$$

Lemma 19 (Clause representation)

 $\langle X \rangle^P$ is equivalent to $(P \equiv X)$.

E.g., $\{[P \overline{x}], [P \overline{y}], [\neg P \times y]\}$ is equivalent to $P \equiv (x \vee y)$.

Complexity Tseitin encoding

Tseitin encoding

Recall that φ is the formula

$$P_1 \wedge (P_1 \equiv (P_2 \vee R)) \wedge (P_2 \equiv (P \wedge \neg Q)).$$

Using the lemma, φ is equivalent to the clause set

$$\{\{[P_1]\} \cup \langle P_2 \vee R \rangle^{P_1} \cup \langle P \wedge \neg Q \rangle^{P_2}\},$$

which again equals

$$\{[P_1],$$

 $[P_1 \neg P_2], [P_1 \neg R], [\neg P_1 P_2 R],$
 $[\neg P_2 P], [\neg P_2 \neg Q], [P_2 \neg P Q]\}.$

DPLL Implementation

DPLL Implementation

Tseitin encoding

Is this any better than the original CNF translation?

- ▶ We will use the number of binary connectives (n) as a measure of the size of our original formula on NNF.
- ▶ We let *m* denote the number of distinct propositional variables.
- ▶ Then the size of the equisatisfiable clause set generated is

$$(3n+1)\times(m+n)\times3.$$

Hence we obtain an instance of 3SAT with a linear (in n) number of clauses, with *n* new variables.

DPLL Implementation Pseudocode algorithm

Pseudocode algorithm

DPLL can be implemented as follows, where DPLL(Γ) = true iff Γ is satisfiable.

```
proc LookAhead(Γ)
  while \Gamma contains unit clause [x]
     perform unit propagation on x
```

```
proc DPLL(Γ)
   LookAhead(\Gamma)
   if \Gamma = \emptyset return true
   if \bot \in \Gamma return false
   x := \mathsf{ChooseLiteral}(\Gamma)
   return DPLL(\Gamma, [x]) or DPLL(\Gamma, [\overline{x}])
```

Jeroslow Wang heuristic

- ▶ The only non-deterministic part is which literal is chosen.
- ▶ Picking the optimal literal is in general NP-hard and coNP-hard [7].
- ▶ Thus it is *harder* than deciding satisfiability of the formula!
- But there exists heuristics.
- Let $\Gamma(x)$ denote the subset of Γ where x occurs.
- ▶ Pick the x that maximizes $w(\Gamma(x))$, where w is the weight function

$$w(\Gamma) = \sum_{k \geqslant 1} \frac{n(\Gamma, k)}{2^k},$$

and $n(\Gamma, k)$ is the number of clauses in Γ of length k.

▶ "Pick an x that occurs in many short clauses."

DPLL Implementation Jeroslow Wang heuristic

Example 2

▶ Unit propagation is performed on Γ , $[\neg Q]$:

$$\frac{[P R], [P \neg R]}{\Gamma, [Q]} \operatorname{Prop}$$

▶ Let $\Gamma' = \{ [P \ R], [P \ \neg R] \}.$

$$\begin{array}{c|c|c|c} x & \neg P & P & \neg R & R \\ \hline w(\Gamma'(x)) & \frac{0}{4} & \frac{2}{4} & \frac{1}{4} & \frac{1}{4} \end{array}$$

ightharpoonup P has the highest weight in Γ' .

Example 2

Let $\Gamma = \{ [\neg P \ Q], [P \ \neg Q \ R], [Q \ S], [P \ \neg R] \}.$

What is $DPLL(\Gamma)$?

- Γ contains no unit clause.
- We calculate $w(\Gamma(x))$ for each x occurring in Γ.

- ightharpoonup Q has the highest weight in Γ .
- ▶ DPLL(Γ) is true if DPLL(Γ , [Q]) or DPLL(Γ , [$\neg Q$]) are.

DPLL Implementation Jeroslow Wang heuristic

Example 2

- ► DPLL(Γ) is true if
 - ▶ DPLL(Γ′, [P]) or
 - ▶ DPLL(Γ' , $[\neg P]$) or
 - ▶ DPLL(Γ , $[\neg Q]$) are.
- ▶ Unit propagation is performed on Γ' , [P]:

$$\frac{\emptyset}{[\neg R]} \operatorname{Prop}$$

$$\Gamma', [P]$$

- ▶ DPLL(Γ' , [P]) returns true, thus
- ► DPLL(Γ) returns true, which means
- Γ is satisfiable.

DPLL Implementation MiniSAT

MiniSAT

MiniSAT won the following categories at SAT Competition 2005:

- ► Industrial SAT+UNSAT
- ► Industrial UNSAT
- ► Industrial SAT
- ► Crafted UNSAT

It didn't do that well at SAT Competition 2007 though.

We can try it on an $3358 \times 1015 \times 3$ problem.
