

Part 2

# INF3480 - Introduction to Robot Operating System

April 26, 2018

Justinas Mišeikis

# Recap of the previous lecture

- What ROS is?
  - Consists of: Plumbing, Tools, Capabilities, Ecosystem
  - Nodes, Topics, Services, Messages, ROS Master
  - RQT Visualisation
  - Rosbag
- Setting up a new ROS installation
  - Creating workspace
  - Compiling
  - Creating package
  - Simple publisher
  - Listen to the topic, rostopic echo

Hands-on

# Lecture Plan

1. Go through ROS-Industrial and MoveIt!
2. Show some example projects made on ROS
3. Practical coding session
4. Leave time for your questions on using ROS

 **MoveIt!**

The MoveIt! logo consists of a blue icon on the left, which is a stylized representation of a robotic gripper or a similar mechanical component. To the right of the icon, the word "MoveIt!" is written in a bold, sans-serif font. The "Move" part is in a dark grey color, and the "It!" part is in a bright blue color.

# Technical Capabilities

- Motion Planning
  - Fast and good quality paths
  - Kinematic Constraints
- Fast and flexible collision checking
- Integrated Kinematics
- Integrated Perception for Environment Representation
- Standardised Interfaces to Controllers
- Execution and Monitoring
- Kinematic Analysis
- Simulated Robots

# Motion Planning

MoveIt! includes a variety of motion planners:

- Sampling-based motion planners  
(implementations from [OMPL])
- Search-based motion planners  
(implementations from SBPL)
- Optimization-based motion planners (CHOMP)

# Motion Planning - Constraints

You can specify the following kinematic constraints:

- **Position constraints** – restrict the position of a link to lie within a region of space
- **Orientation constraints** – restrict the orientation of a link to lie within specified roll, pitch or yaw limits
- **Visibility constraints** – restrict a point on a link to lie within the visibility cone for a particular sensor
- **Joint constraints** – restrict a joint to lie between two values
- **User-specified constraints** – you can also specify your own constraints with a user-defined callback.

# Collision Detection

Flexible Collision Library (FCL) is used.

Types of objects supported:

- Meshes
- Primitive shapes (boxes, cylinders, cones)
- Octomap

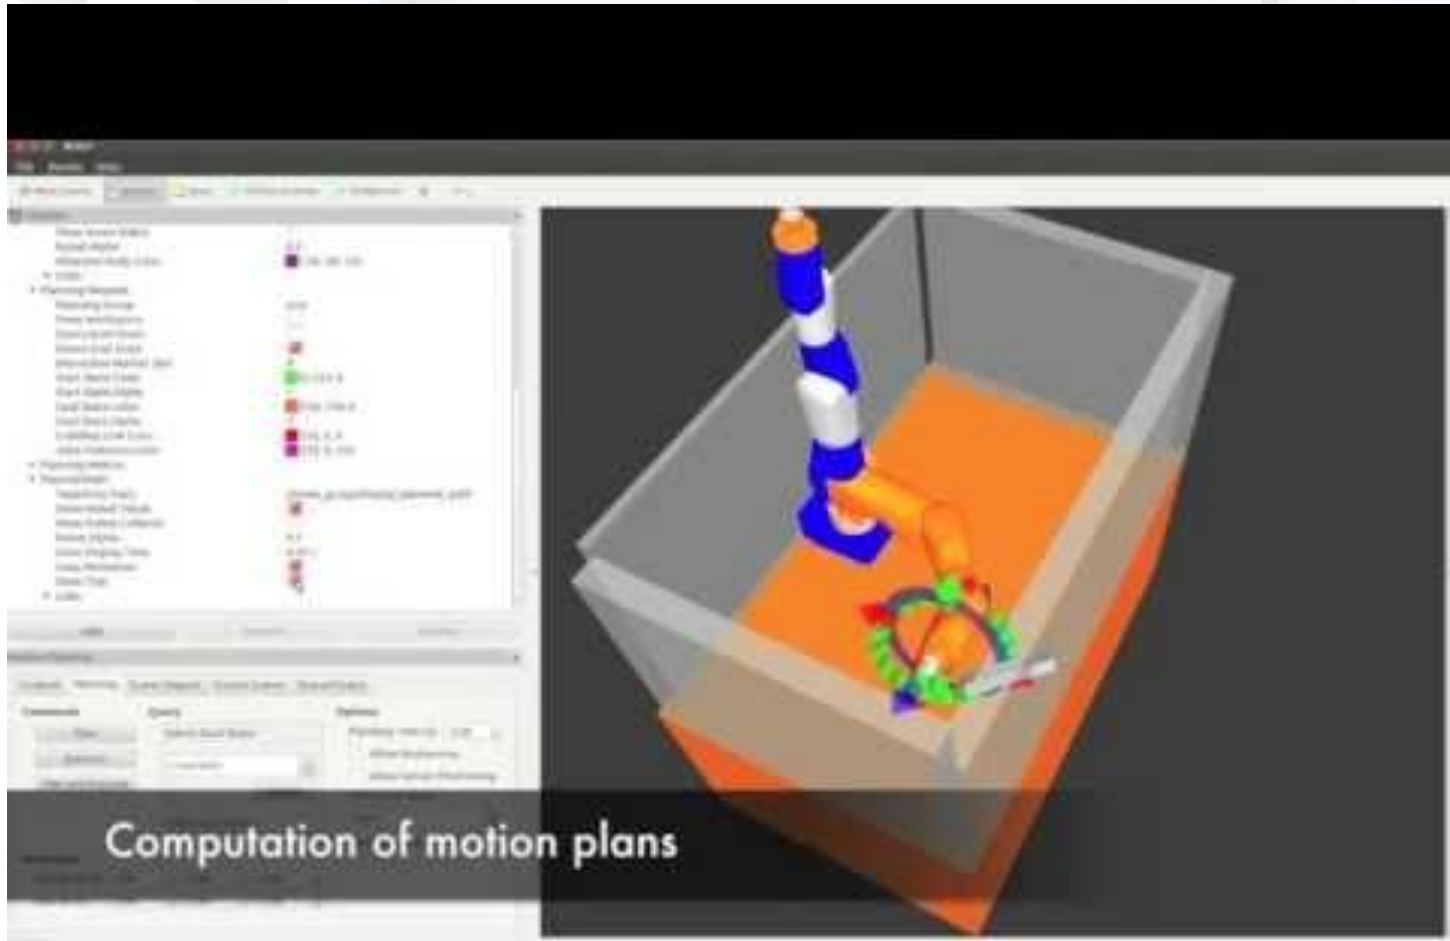

40,000 to 80,000 collision checks per second!

# Movelt - Robot Setup Assistant

# Movelt Capabilities

# How to use it?

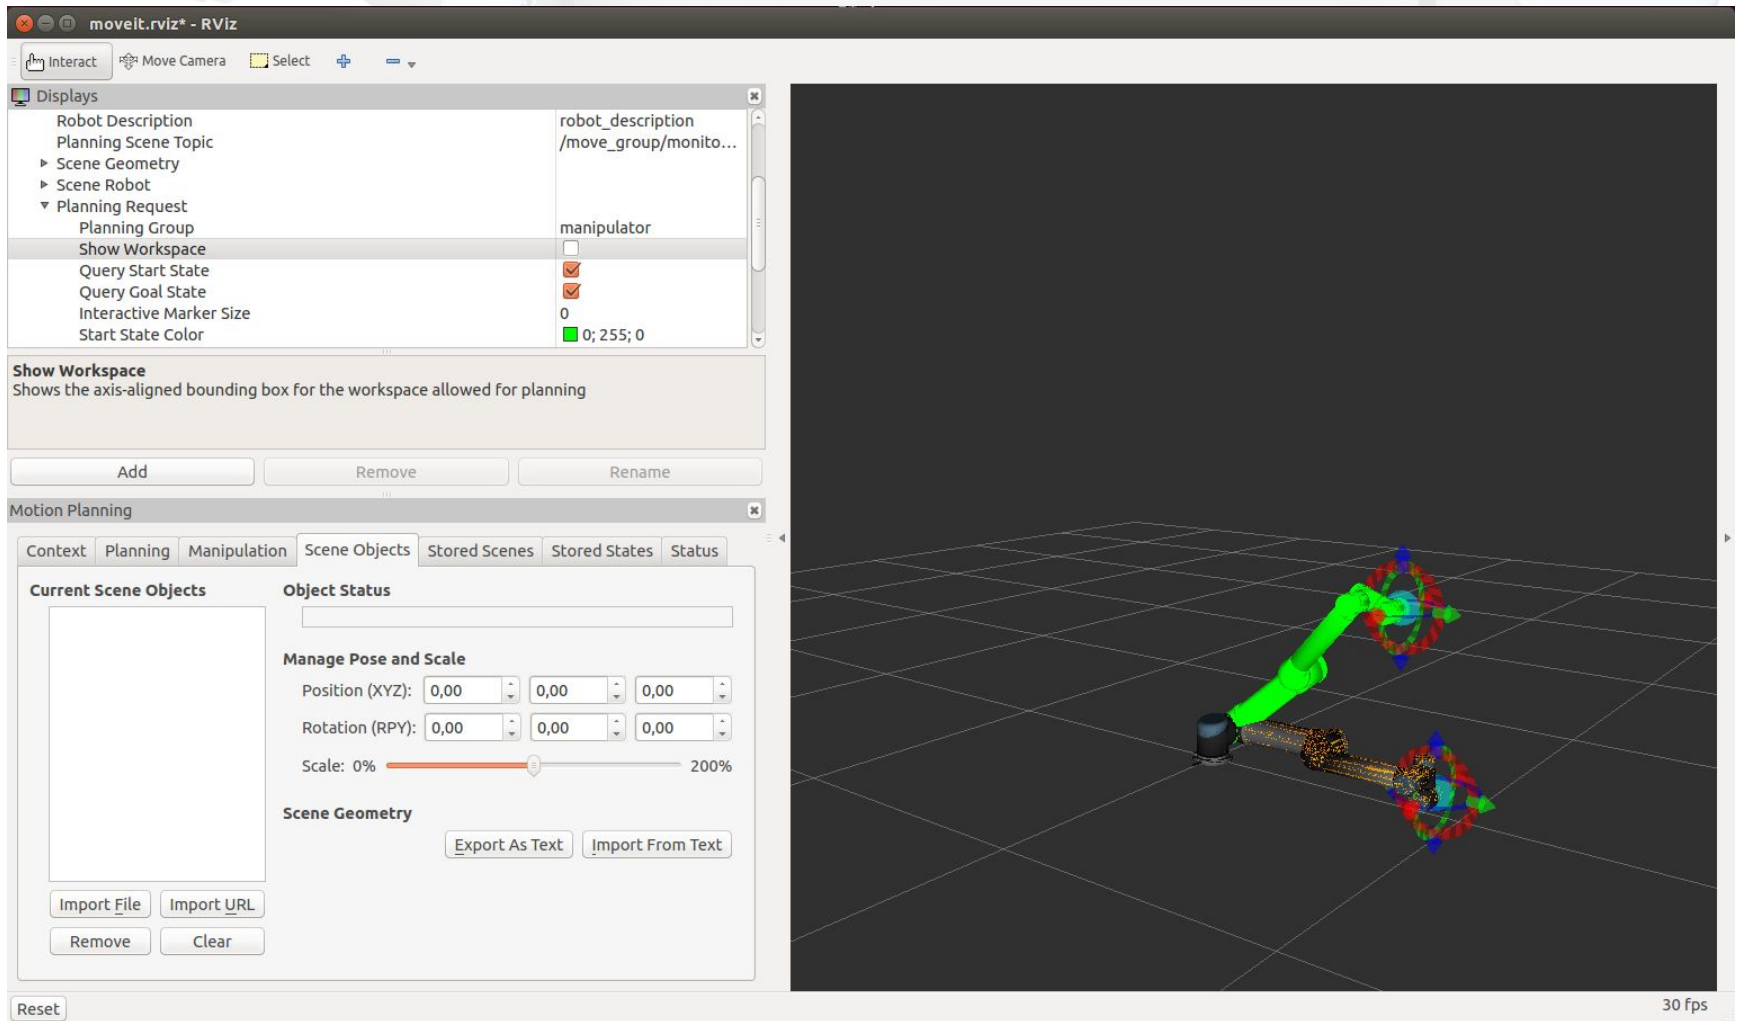

To simulate and play around with Universal Robot UR5

- 1) Have ROS installed (example version: Kinetic)
- 2) Install MoveIt for UR5:
  - “sudo apt-get install ros-kinetic-ur5-moveit-config”
- 3) Launch UR5 RViz simulator:
  - “roslaunch ur5\_moveit\_config demo.launch”

That's it!

[http://wiki.ros.org/universal\\_robot/Tutorials/Getting%20Started%20with%20a%20Universal%20Robot%20and%20ROS-Industrial](http://wiki.ros.org/universal_robot/Tutorials/Getting%20Started%20with%20a%20Universal%20Robot%20and%20ROS-Industrial)

# How to use it?

The screenshot displays the MoveIt! RViz interface. The main 3D view shows a robot arm with a green gripper and a blue base, positioned on a grid floor. The interface includes several panels:

- Displays:** A tree view on the left showing the hierarchy of displayed elements. The right pane shows the configuration for the selected 'manipulator' display, including 'robot\_description' and '/move\_group/monito...'. Checkmarks are visible for 'Query Start State' and 'Query Goal State'. The 'Start State Color' is set to green with values '0; 255; 0'.
- Show Workspace:** A panel below the displays that shows the axis-aligned bounding box for the workspace allowed for planning.
- Motion Planning:** A panel with tabs for 'Context', 'Planning', 'Manipulation', 'Scene Objects', 'Stored Scenes', 'Stored States', and 'Status'. The 'Scene Objects' tab is active, showing 'Current Scene Objects' (an empty list), 'Object Status', 'Manage Pose and Scale' (with fields for Position (XYZ) and Rotation (RPY) all set to 0,00, and a Scale slider from 0% to 200%), and 'Scene Geometry' (with 'Export As Text' and 'Import From Text' buttons).
- Buttons:** 'Add', 'Remove', and 'Rename' buttons are located below the 'Show Workspace' panel. 'Import File', 'Import URL', 'Remove', and 'Clear' buttons are located below the 'Scene Objects' panel. A 'Reset' button is at the bottom left.

**Future?**

**ROS 2**

**coming soon...**

# Summary

- ROS is a meta-operating system for robotics
- Provides basic (and many!) algorithms for robotics
- Modular approach allows easy adaptation to hardware changes and both hw and sw updates
- Effective visualisation and simulation tools
- World-wide spread in research and commercial use
- BSD license - open source, free to use!
- Over 120 robot platforms support ROS, and growing!
- Easy to start
- Linux based, best works on Ubuntu
- Easy to parallelise, nodes based approach communicate over TCP and can be synchronised using timestamps for messages
