

# INF3510 Information Security

## University of Oslo

### Spring 2014

University of Oslo  
Spring 2014

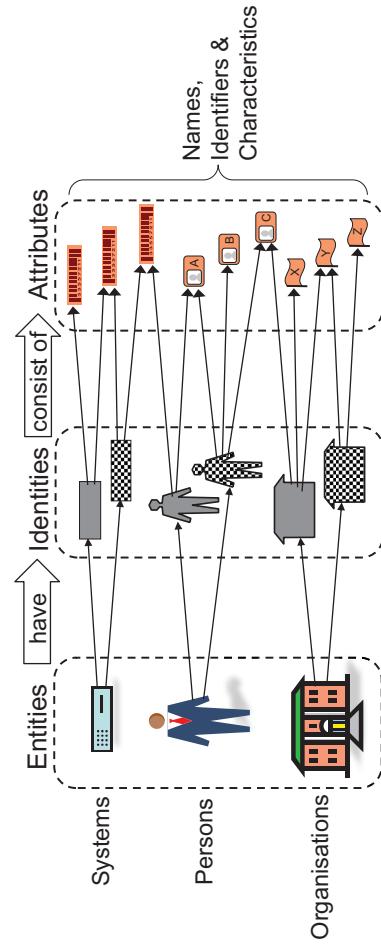

## Lecture 9

### Identity Management and Access Control

## Outline

- Identity and access management concepts
- Identity management models
- Access control models (security models)
- Open authorization

## The concept of identity

## Concepts related to identity

- Entity
  - A person, organisation, agent, system, etc.
- Identity
  - A set of names / attributes of entity in a specific domain
  - An entity may have multiple identities in one domain
- Digital identity
  - Digital representation of names / attributes in a way that is suitable for processing by computers
- Names and attributes of entity
  - Can be unique or ambiguous within a domain
    - Transient or permanent, self defined or by authority, interpretation by humans and/or computers, etc

# Identity

- Etymology (original meaning of words)
  - “identity” = “same one as previous time”.
- “First-time” authentication is not meaningful
  - because there is no “previous time”
- Authentication requires a first time registration of identity in the form of a name within a domain
- Registration can be take two forms:
  - pre-authentication, from previous identity, e.g. passport
  - creation of new identity, e.g. New born baby

L09 - Id Man & AC

INF3510 - Uio 2014

5

## Identity Domains

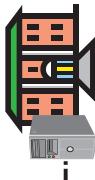

- An Id domain has a name space of unique names
- Management structure options:
  - Single authority, e.g. User Ids in company network
  - Hierarchical: e.g. DNS (Domain Name System)
- Integration/federation of Id domains
  - Requires mapping of identities of same entity
  - Requires alignment of policies / single policy
- This lecture focuses on user identities, not SP identities

L09 - Id Man & AC

INF3510 - Uio 2014

7

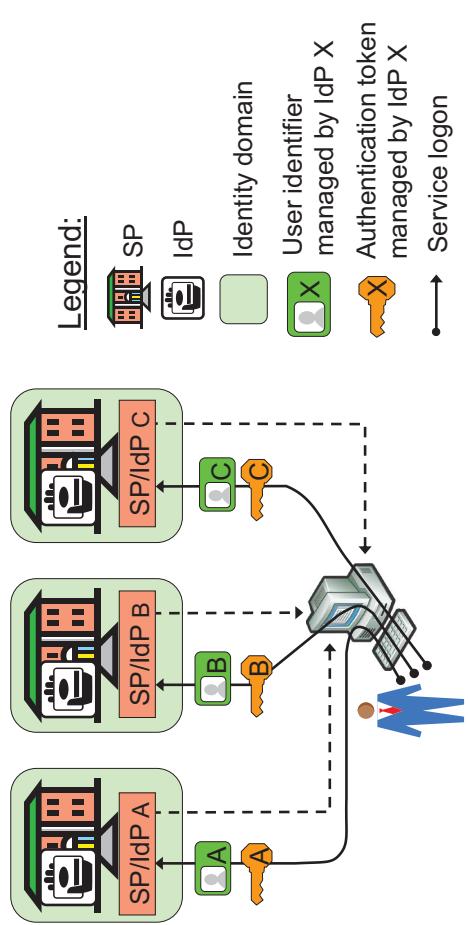

# Identity management processes

User Side	Service Provider Side
	
<b>User Identity Management</b>   / 	IdMan processes for user Ids & credentials on SP side
<b>SP Identity Management</b>  	IdMan processes for SP Ids & credentials on SP side

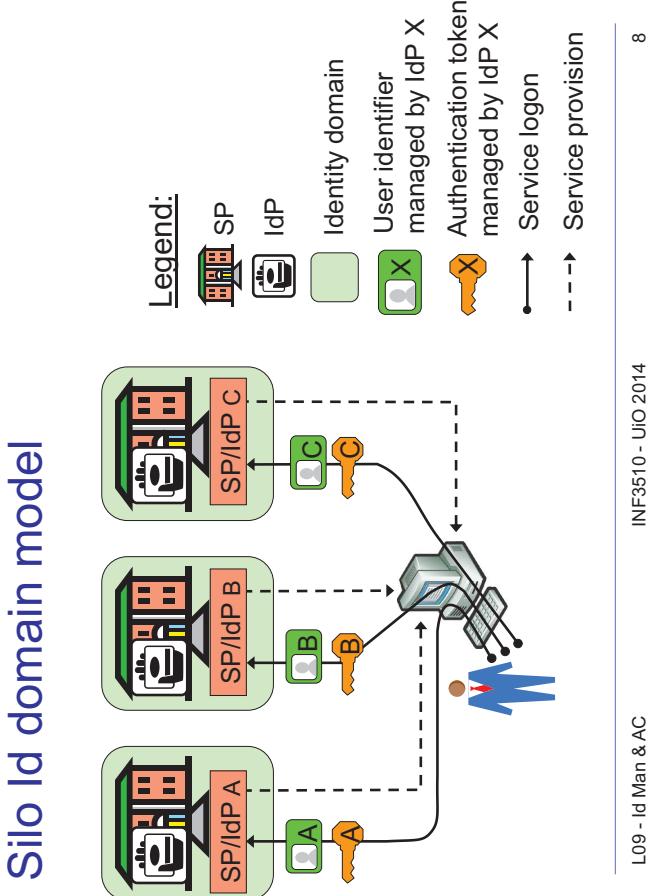

6

INF3510 - Uio 2014

## Silo Id domain model

L09 - Id Man & AC	INF3510 - Uio 2014	8
-------------------	--------------------	---

INF3510 - Uio 2014

7

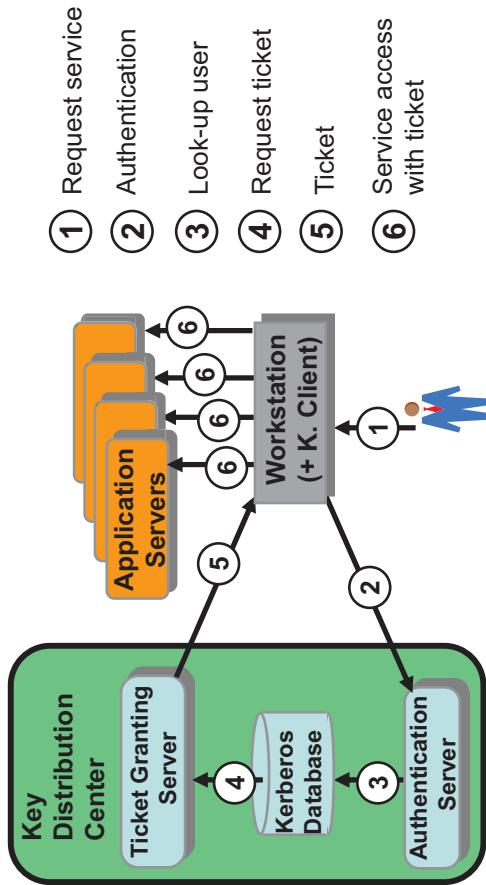

## Silo Id domains

- SP = IdP: defines name space and provides access credentials
- Unique identifier assigned to each entity
- Advantages
  - Simple to deploy, low cost for SPs
- Disadvantages
  - Identity overload for users, poor usability, lost business
- Users don't want more identifiers and credentials
- Low acceptance of new services that require separate user authentication
- Silo model requires users to provide same information to many service providers
- Silo model makes it difficult to offer bundled services, i.e. from different service providers
- Service providers want to bundle and collect user information

## Kerberos SSO

- Part of project Athena (MIT) in 1983.
- User must authenticate once at the beginning of a workstation session (login session).
- Server then authenticates Kerberos client on user's workstation instead of authenticating the user
  - So user does not need to enter password every time a service is requested!
- Every user shares a password with the AS (Authentication Server)
- Every SP (service provider) shares a secret key with the TGS (Ticket Granting Server)
- Tickets are sealed (encrypted) by TGS proves to SPs that the user has been authenticated

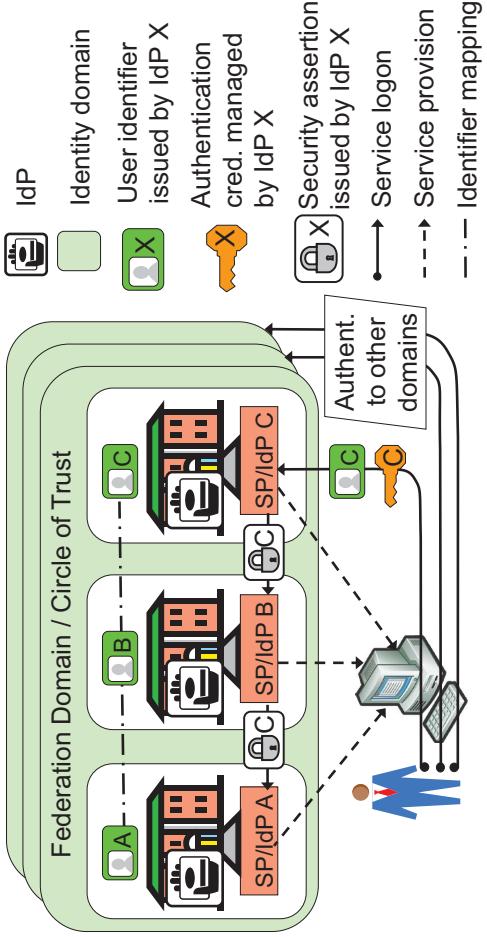

## Kerberos – simplified protocol

## Kerberos – Advantages and limitations

- First practical SSO solution
- Centralized TTP (Trusted Third Party) model
- Uses only symmetric cryptography
- Requires Kerberos clients and servers + KDC
- Only suitable for organisations under common management (single domain)
  - Does not scale to very large domains
  - Not suitable for open environments (Internet)

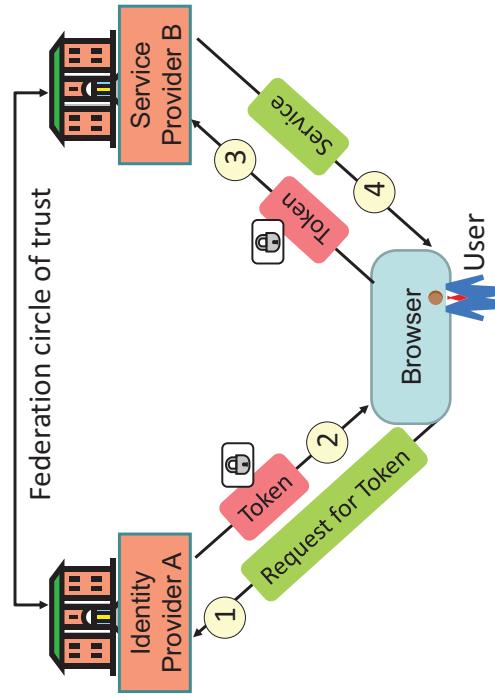

## Federated model (distributed)

Examples: Liberty Alliance, SAML2.0, WS-Federation, Shibboleth

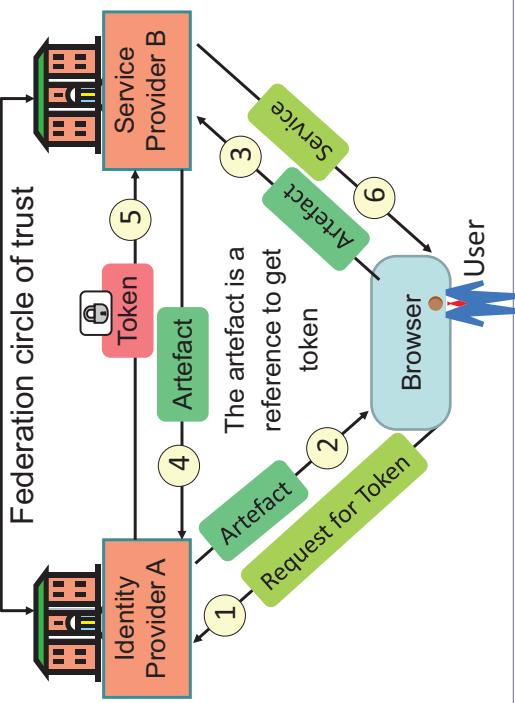

L09 - Id Man & AC INF3510 - UiO 2014 14

## SAML protocol profile: Browser Post Security token via front-end

L09 - Id Man & AC INF3510 - UiO 2014 15

## SAML protocol profile: Browser Artefact Security token via back-end

L09 - Id Man & AC INF3510 - UiO 2014 16

## Federated SSO

- Identity Federation
  - A set of agreements, standards and technologies that enable a group of SPs to recognise user identities, credentials & entitlements from another IdP (Identity Provider) or from other SPs
- Two alternatives:
  1. **Centralized Federation:** Single user name & credential for accessing all domains, with centralized IdP and authentication
  2. **Distributed Federation:** Separate user name & credential for each domain, with mapping between a user's different names in different domains, and distributed IdPs and authentication.
- Authentication by one IdP or SP is communicated as a security assertions (cryptographic token) to other SPs that trust and accept it
  - Provides SSO in open environments

L09 - Id Man & AC INF3510 - UiO 2014 17

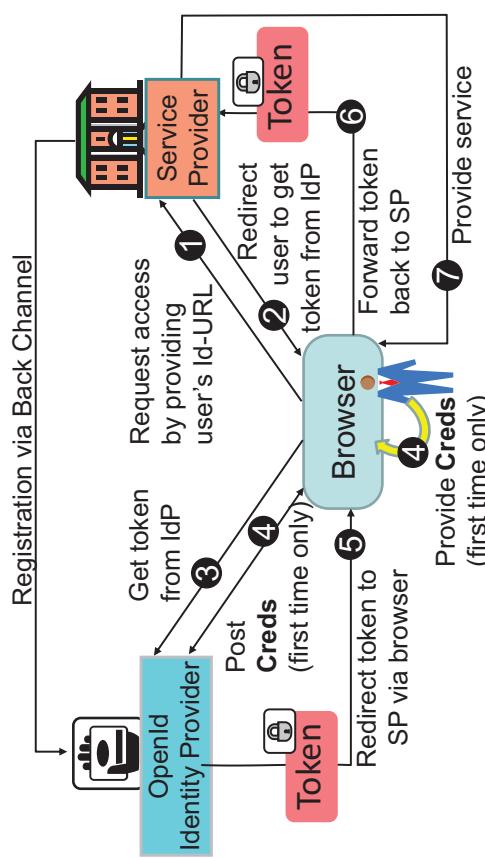

L09 - Id Man & AC INF3510 - UiO 2014 18

## Federated SSO

- Advantages
  - Improved usability (theoretically)
  - Compatible with silo user-identity domains
  - Allows SPs to bundle services and collect user info
- Disadvantages
  - High technical and legal complexity
  - High trust requirements
    - E.g. SP-A is technically able to access SP-B on user's behalf
  - Privacy issues
  - Unimaginable for all SPs to federate,
    - multiple federated SSOs not much better than silo model

L09 - Id Man & AC INF3510 - UiO 2014 18

## OpenID authentication protocol - details

L09 - Id Man & AC INF3510 - UiO 2014 18

## OpenID self registration

Screenshot of an Internet Explorer browser window titled "Sign Up - Windows Internet Explorer". The URL is https://www.myopenid.com/signup. The page displays the following steps:

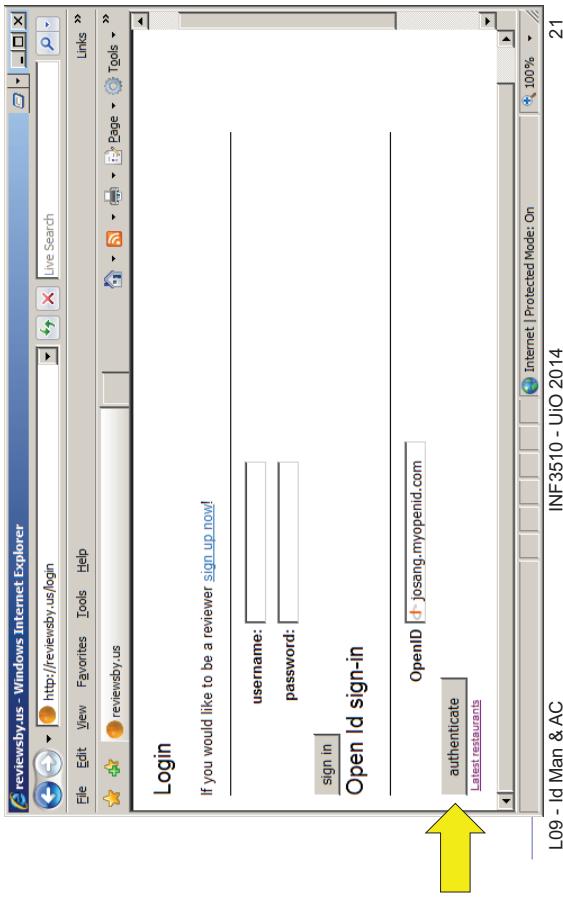

1. CHOOSE YOUR USERNAME  
Your OpenID URL is how sites that accept OpenID know you. You can use your name or anything that you want to be known by.  
Username: josang  
John Doe, jdoe123  
OpenID URL: http://josang.myopenid.com/
2. CHOOSE A PASSWORD  
You'll use this password to sign in to myOpenID, but you won't have to give it to any other site.  
Password:  fred  
Password (confirm):  **bad password**  
Strength: **bad password**

L09 - Id Man & AC INF3510 - UiO 2014 18

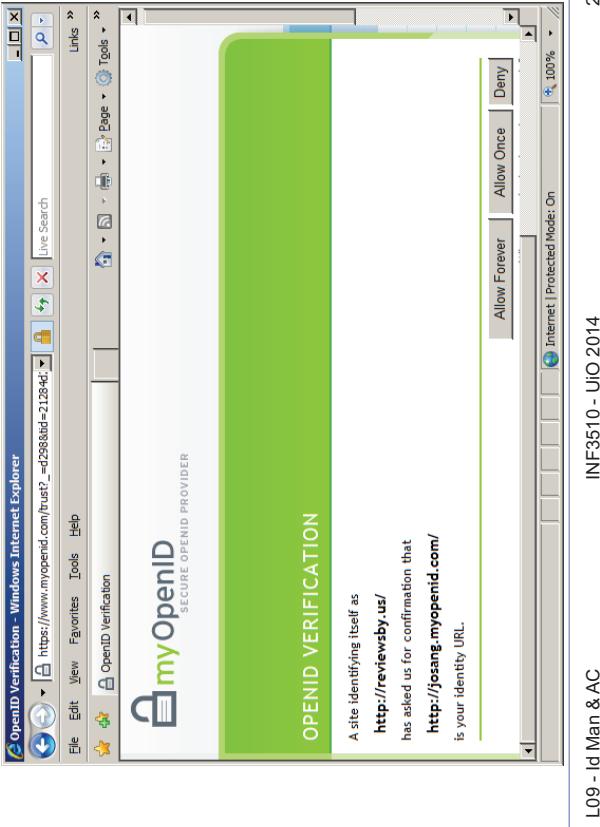

L09 - Id Man & AC INF3510 - UiO 2014 19

L09 - Id Man & AC INF3510 - UiO 2014 20

## Service Access Without Password

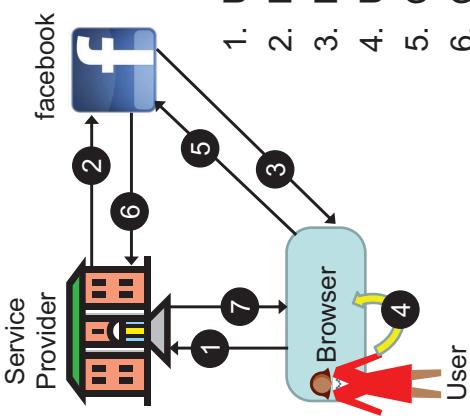

## First Time Service Access

## OpenID Characteristics

- Self registration
- Anybody can be IdProvider and Server, also you
- Not all IdProviders are recognised as "authorities"
- A SP can specify which IdPs it accepts
- Not suitable for sensitive services
- Typically for services that only require low authentication assurance
- Vulnerable to multiple forms of abuse

## Authentication via Facebook Connect

(Felles Elektronisk Identitet)

- FEIDE is a system for Id management within the Norwegian national education sector.
  - Users register username and password with own home organisation
  - Users authenticate to web-services via FEIDE's centralized login service
  - The Service Provider receives user attributes from the user's Home Institution
  - The Service Providers never sees the user's password/credential, it only receives user attributes that it need to know in order to provide the service.

Høg - Id Man & Ac |NE3510 - UiO 2014 25

Høg - Id Man & AC  
NFE3510 - UiO 2014  
26

 FEIDE

(continued)

- FEIDE has formal agreements with the universities and schools before they are connected
  - Home Institutions (universities and schools) are responsible for keeping user data correct and up-to-date
  - Service Providers decide themselves what services their own users and other users should be able to access via FEIDE's central log-in service.

Høg - Id Man & AC  
NFE3510 - UiO 2014  
26

FEIDE Scenario

1. User requests access to service
2. Service Provider sends authentication request to FEIDE, and displays FEIDE login form to user.
3. User enters name and password in FEIDE login form, which are sent for validation to Home Institution of user.
4. Home Institution confirms authentic user and provides user attributes to FEIDE which forwards these to SP
5. Service Provider analyses user attributes and provides service according to policy

- Based on SAML 2.0
- Backend authenticate users by using LDAP
- One central identity provider (IdP) where service providers (SPs) are connected
- Single Sign On when going between services
- Single Log Out when logging out from a service

**FEIDE** Technical Aspects

29

INF3510 - UiO 2014

30

## Introduction to Logical Access Control

L09 - Id Man & AC

29

INF3510 - UiO 2014

30

## Basic concepts

- Access control security models:
  - How to define which subjects can access which objects with which access modes?
- Three classical approaches
  - Discretionary Access Control (DAC)
  - Mandatory access control (MAC)
  - Role-Based Access Control (RBAC)
- Advanced approach for distributed environments:
  - Attribute-Based Access Control (ABAC)
    - Generalisation of DAC, MAC and RBAC

L09 - Id Man & AC

31

INF3510 - UiO 2014

L09 - Id Man & AC

INF3510 - UiO 2014

32

## DAC / MAC According to the Orange Book (TCSEC)

TCSEC (1985) specifies two AC security models

### Discretionary AC (DAC)

- AC policy based on user identities
- e.g. John has  $(x, w)$  - access to HR-files

	HR	Sales
John	x, w	
Mary		x, w

### Mandatory AC (MAC)

- AC policy based on security labels
- e.g. secret clearance needed for access

L09 - Id Man & AC INF3510 - UiO 2014 33

Orange Book, 1985

Secret

L09 - Id Man & AC INF3510 - UiO 2014 33

## DAC principles

- AC Matrix
  - General list of authorizations
  - Impractical, too many empty cells
- Access Control Lists (ACL)
  - Associated with an object
  - Represent columns from AC Matrix
  - Tells who can access the object

O1	O2	O3	O4
S1	r,w	-	x
S2	r	-	r,w
S3	-	x	-
S4	r,w	x	x

Subject names	S1	S2	S3	S4	O4
Objects	r,w	r	-	r	r,w
S1	r,w	-	x	-	r
S2	r	-	x	x	r,w
S3	-	x	-	x	-
S4	r,w	x	x	x	x

Columns → ↓ Rows	Objects			
Subject names	S1	S2	S3	S4
S1	r,w	-	x	r
S2	r	-	r	r,w
S3	-	x	-	-
S4	r,w	x	x	x

## ACL in Unix

Each file and directory has an associated ACL

- ◆ Three access operations:
  - read: from a file
  - write: to a file
  - execute: a file
- Permission bits are grouped in three triples that define read, write, and execute access for owner, group and others.
- A '-' indicates that the specific access right is not granted.
- rwx----- means: read and write access for the owner, read access for group, and for others (world).
- rwx----- means: read, write, and execute access for the owner, no rights for group and no rights for others

L09 - Id Man & AC INF3510 - UiO 2014 35

L09 - Id Man & AC INF3510 - UiO 2014 34

L09 - Id Man & AC INF3510 - UiO 2014 35

## Capabilities

- Focus on the subjects:
  - access rights stored with subjects
  - Represents rows of AC Matrix
- Must be impossible for users to create fake capabilities
- Subjects may grant own capabilities to other subjects.  
Subjects may grant the right to grant rights.
- Challenges:
  - How to check who may access a specific object?
  - How to revoke a capability?
  - Similar to SAML security token

		AC Capabilities			
		O1	O2	O3	O4
		r,w	-	x	r
S1					
S2					r,w
S3					
S4					

L09 - Id Man & AC INF3510 - UiO 2014 37

L09 - Id Man & AC INF3510 - UiO 2014 38

## MAC principles: Labels

- Security Labels can be assigned to subjects and objects
  - Can be strictly ordered security levels, e.g. "Confidential" or "Secret"
  - Can also be partially ordered categories, e.g. {Sales-dep, HR-dep}
- Dominance relationship between labels
  - ( $L_A \geq L_B$ ) means that label  $L_A$  dominates label  $L_B$
- Object labels are assigned according to sensitivity
- Subject labels are determined by security clearance
- Access control decisions are made by comparing the subject label with the object label according to specific model
- MAC is typically based on Bell-LaPadula model (see later)

L09 - Id Man & AC INF3510 - UiO 2014 39

## Bell-LaPadula: The classical MAC model

### SS-property (Simple Security): No Read Up

- A subject should not be able to read files with a higher label than its own label, because otherwise it could cause unauthorized disclosure of sensitive information.
- So you should only be able to read documents with an equal or lower label as your security clearance level.

### \*Property (Star Property): No Write Down

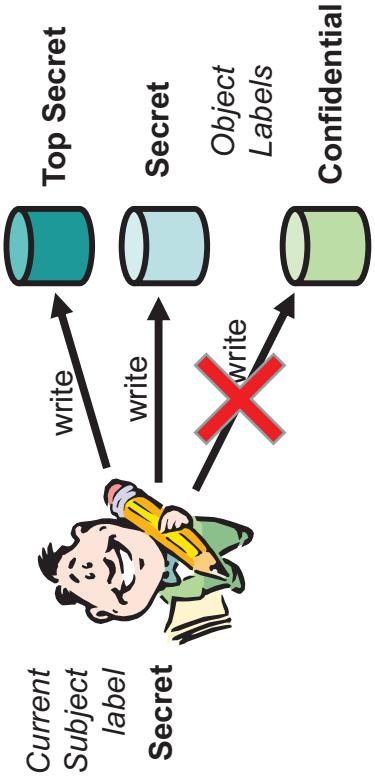

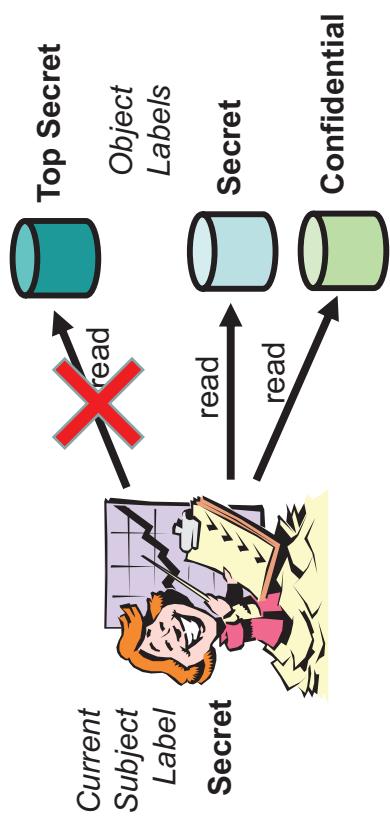

- Subjects working on information/tasks at a given level should not be allowed to write to a lower level, because otherwise it could create unauthorized information flow.
- So you should only be able write to files with an equal or higher label as your security clearance level.

L09 - Id Man & AC INF3510 - UiO 2014 40

## Bell-LaPadula (MAC model)

\*-Property: No Read Up

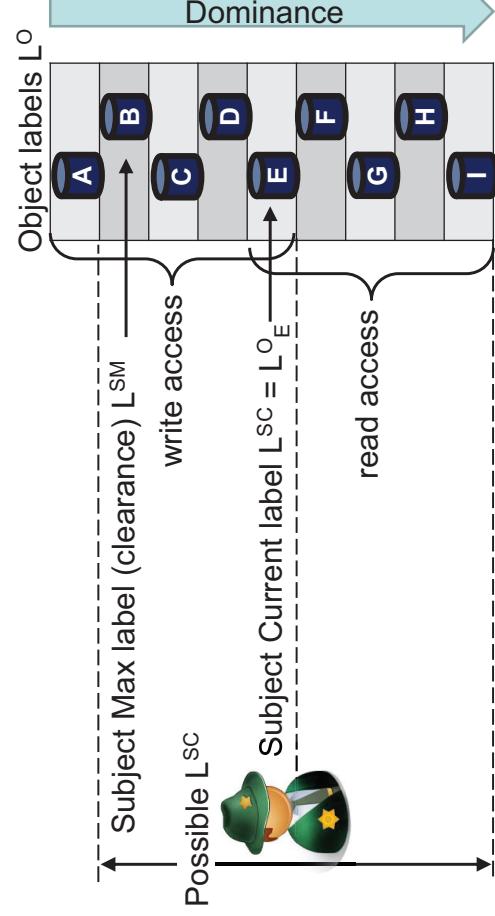

Diagram: Bell-LaPadula (MAC model)

## Labels in Bell La Padula

- Users have a clearance level  $L^{SM}$  (Subject Max level)
- Users log on with a current clearance level  $L^{SC}$  (Subject Current level) where  $L^{SC} \leq L^{SM}$
- Objects have a sensitivity level  $L^O$  (Object)
- SS-property allows read access when  $L^{SC} \geq L^O$
- \*-property allows write access when  $L^{SC} \leq L^O$

## Bell-LaPadula label relationships

## Combined MAC & DAC

- Combining access control approaches:
  - A combination of mandatory and discretionary access control approaches is often used
    - MAC is applied first,
    - DAC applied second after positive MAC
      - Access granted only if both MAC and DAC positive
  - Combined MAC/DAC ensures that
    - no owner can make sensitive information available to unauthorized users, and
    - 'need to know' can be applied to limit access that would otherwise be granted under mandatory rules

L09 - Id Man & AC

INF3510 - UiO 2014

45

46

## RBAC: Role Based Access Control

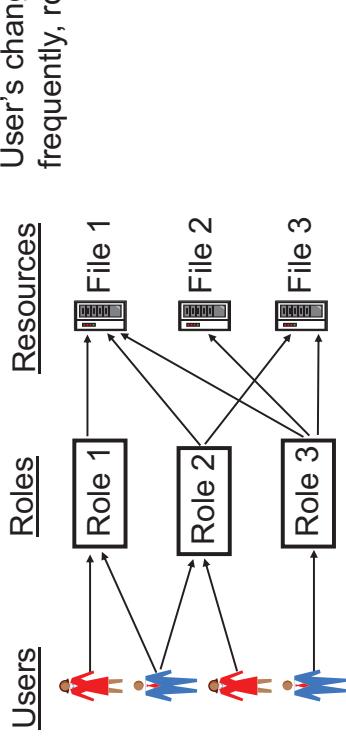

- A user has access to an object based on the assigned role.
  - Roles are defined based on job functions.
  - Permissions are defined based on job authority and responsibilities within a job function.
  - Operations on an object are invoked based on the permissions.
  - The object is concerned with the user's role and not the user.

L09 - Id Man & AC

INF3510 - UiO 2014

46

## RBAC Flexibility

## RBAC Privilege Principles

- Roles are engineered based on the principle of least privilege .
- A role contains the minimum amount of permissions to instantiate an object.
- A user is assigned to a role that allows her to perform only what's required for that role.
- All users with the same role have the same permissions.

L09 - Id Man & AC

INF3510 - UiO 2014

47

48

ABAC and XACML

Attribute Based Access Control

- ABAC specifies access authorizations and approves access through policies combined with attributes. The policy rules can apply to any type of attributes (user attributes, resource attribute, context attributed etc.).
  - XACML used to express ABAC attributes and policies.

### **XACML = eXtensible Access Control Markup Language**

  - The XACML standard defines a language for expressing access control attributes and policies implemented in XML and a processing model describing how to evaluate access requests according to the rules defined in policies.
  - XACML attributes are typically structured in ontologies

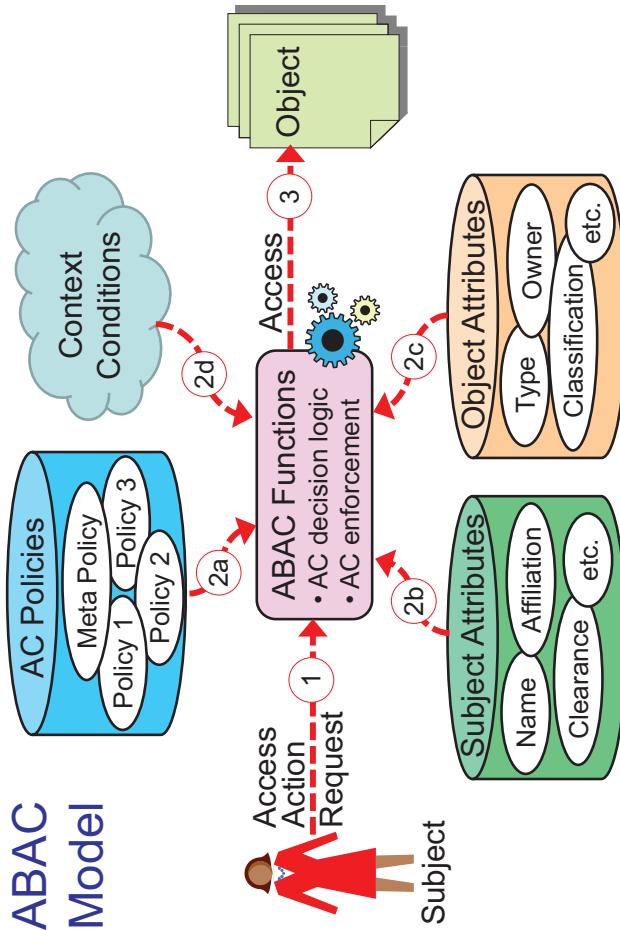

10 | 09 - 10 Man & AC INE3510 - Lido 2014

109 - Id Man & AC  
NE351050110 2014

- ABAC makes AC decisions based on Boolean conditions on attribute values.
  - **Subject**, **Object**, **Context**, and **Action** consist of attributes
    - Subject attributes could be: Name, Sex, DOB, Role, etc.
    - Each attributes has a value, e.g.:
      - (Name (subject) = Alice), (Sex(subject) = F), (Role(subject) = HR-staff), (AccessType(action) = {read, write}), (Owner(object) = HR), (Type(object) = salary)
  - The AC logic analyses all (attribute = value) tuples that are required by the relevant policy.
    - E.g. permit if:
      - [  $\text{Role}(\text{subject}) = \text{HR-staff}$  ] and [  $\text{AccessType}(\text{action}) = \text{read}$  ] and [  $\text{Owner}(\text{object}) = \text{HR}$  ] and [  $\text{Time}(\text{query}) = \text{office-hours}$  ] ]

INE351050 JIIO 2014

ABAC  
Model

NE3510 - 11/10/2014

Global Consistency

- ABAC systems require an XML terminology to express all possible attributes and their values,
  - Must be consistent across the entire domain,
    - e.g. the attribute Role and all its possible values, e.g. (Role(subject) = HR-staff), must be known and interpreted by all systems in the AC security domain.
  - Requires standardization:
    - e.g. for access to medical journals, medical terms must be interpreted in a consistent way by all system
      - current international work on XML of medical terms
  - Consistent interpretation of attributes and values is a major challenge for implementing ABAC.

卷之八

INF3510 - IliO 2014  
na - Id Man & AC 51

INE3510 - IiO 2014

## ABAC: + and –

### On the positive side:

- ABAC is much more flexible than DAC, MAC or RBAC
  - DAC, MAC and RBAC can be implemented with ABAC
- Can use any type of access policies combined with an unlimited number of attributes
- Suitable for access control in distributed environments
  - e.g. national e-health networks

### On the negative side:

- Requires defining business concepts in terms of XML and ontologies which is much more complex than what is required in traditional DAC, MAC or RBAC systems.
- Political alignment and legal agreements required for ABAC in distributed environments

L09 - Id Man & AC INF3510 - UiO 2014 53

L09 - Id Man & AC INF3510 - UiO 2014 54

## Meta-policies i.c.o. inconsistent policies

- Sub-domain authorities defined their own policies
  - Potential for conflicting policies
    - E.g. two policies dictate different access decisions
  - Meta-policy rules needed in case the ABAC logic detects policy rules that lead to opposite decisions
    - Meta-policy takes priority over all other policies, e.g.
      - Meta-Policy Deny Overrides: If one policy denies access, but another policy approves access, then access is denied. This is a conservative meta-policy.
      - Meta-Policy Approve Overrides: If one policy denies access, but another policy approves access, then access is approved.
      - This is a lenient meta-policy.

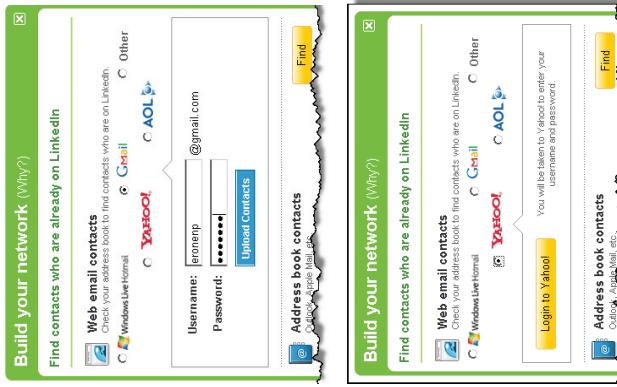

## Web Access Delegation with OAuth

- OAuth: Open Authorization

- OAuth provides a way to grant access to your user data stored on a specific website A to a third party website B, without needing to provide this website B with your authentication credentials for accessing website A.

L09 - Id Man & AC INF3510 - UiO 2014 54

## User authorizes access to own account

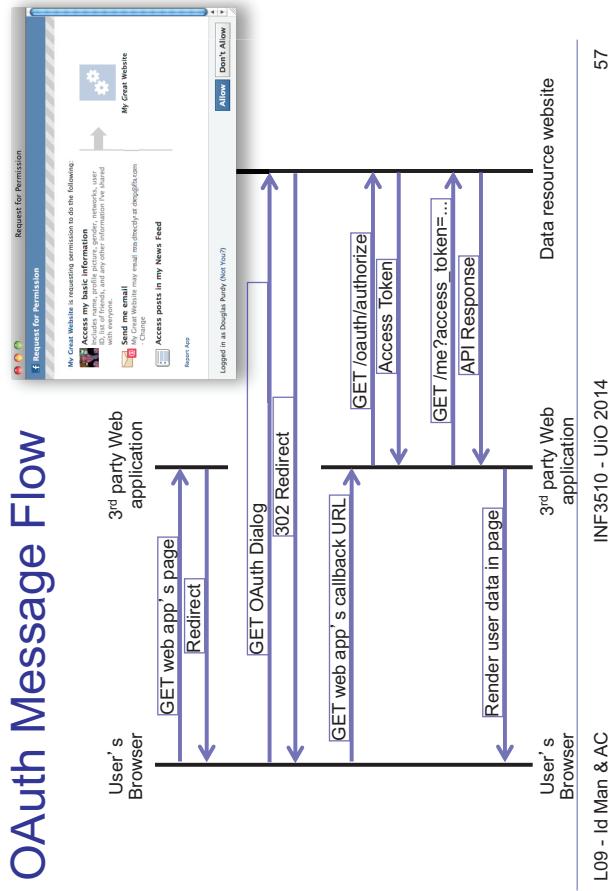

The screenshot shows two versions of the LinkedIn 'Build your network' page. The left version, labeled 'Without OAuth', shows a form for entering a LinkedIn address book contact. The right version, labeled 'With OAuth', shows a form for entering a Yahoo! address book contact. Both versions include a 'BAD' rating icon below the forms.

L09 - Id Man & AC INF3510 - UiO 2014 54

INF3510 - UiO 2014 56

## OAuth remarks

- Open Web Authorization (OAuth) is developed within the IETF to provide delegated access authorization between Web-based applications.
  - Usage for non-Web based applications has been proposed as well.
- OAuth is a relatively recent technology which is rapidly evolving, and is therefore not well studied from a security perspective.

End of lecture
