

# INF3510 Information Security

---

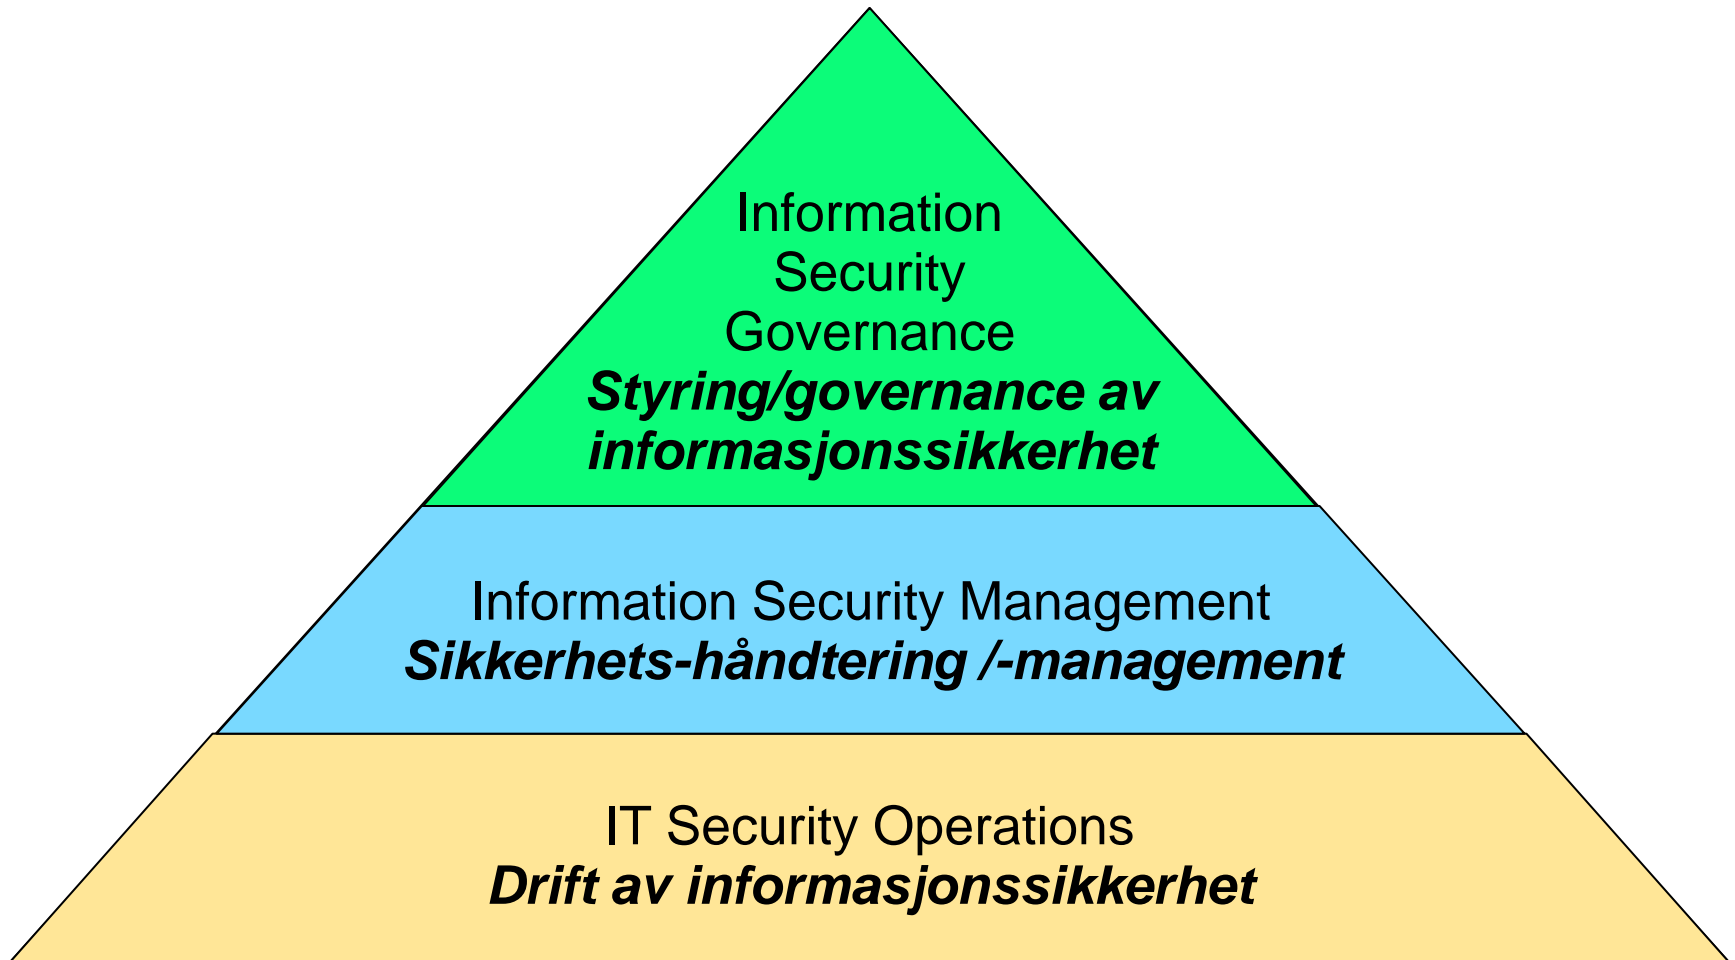

## Lecture 02:

- Information Security Management
- Human Factors for Information Security

University of Oslo, spring 2015

# IT Security Management concepts

# Defining Information Security Governance

IS governance provides strategic direction, ensures objectives are achieved, manages risk appropriately, uses organizational resources responsibly, and monitors the success or failure of the enterprise security programme.

- IT Governance Institute

# COBIT

## Control Objectives for Information and Related Technology

- COBIT is a framework for IT management & governance. It is a set of controls and processes for bridging the gap between business risks and IT control requirements.
- COBIT defines key IT process activities together with their input and output, IT process objectives, performance measures and an elementary maturity model.
- COBIT also describes security management processes.
- COBIT is published and maintained by ISACA, the **Information Systems Audit and Control Association**
- ISACA first released COBIT in 1996;
- The current COBIT 5 was released in 2012.

# Goals of information security governance as defined in COBIT by ISACA

1. Strategic alignment of security program
2. Risk management
3. Value delivery
4. Resource management
5. Performance measurement
6. Assurance process integration

<http://www.isaca.org/Knowledge-Center/Research/Documents/InfoSecGuidanceDirectorsExecMgt.pdf>

# ISACA - Mål for styring av it-sikkerhet

1. Strategisk tilpasning av sikkerhetsprogrammet
  - IS-aktiviteter skal støtte organisasjonens helhetlige strategi.
2. Risikohåndtering
  - Gjøre nødvendige undersøkelser for å avdekke trusler, sårbarheter og risiko som organisasjonen står overfor, og bruke adekvate virkemidler for å redusere risiko til et akseptabelt nivå.
3. Verdiskapning
  - Søk optimal balanse mellom reduksjon av risiko og tap, og kostnader forbundet med sikkerhetsvirkemidler.
4. Ressursbruk
  - Arbeidet med informasjonssikkerhet skal gjøres effektivt
5. Målbarhet
  - Effekten av sikkerhetsarbeidet skal måles
6. Integrering av sikkerhetsområder
  - Separate områder relatert til sikkerhet (fysisk, finansiell, IT etc) skal i størst mulig grad integreres

# What is information security management?

Includes:

- Risk management,
- Security policies (creation and maintenance)
  - Documented goals, rules and practice for IS
- Plan and organisation for managing the security activities
  - Information Security Management System (ISMS)
- Information classification
- Definition of security procedures, standards & guidelines
- Deployment and maintenance of security controls
- Security education and training
- Disaster recovery and business continuity planning

# Who is responsible for ISM?

- Management
  - CEO, CSO, CIO
  - Allocate resources, endorse and abide security policies
- IT Security staff
- General security staff, i.e. guards, janitors etc.
  - Important for physical security
- IT staff
- Users
- Third parties
  - Outsourced information security management
  - Customers, suppliers, business partners

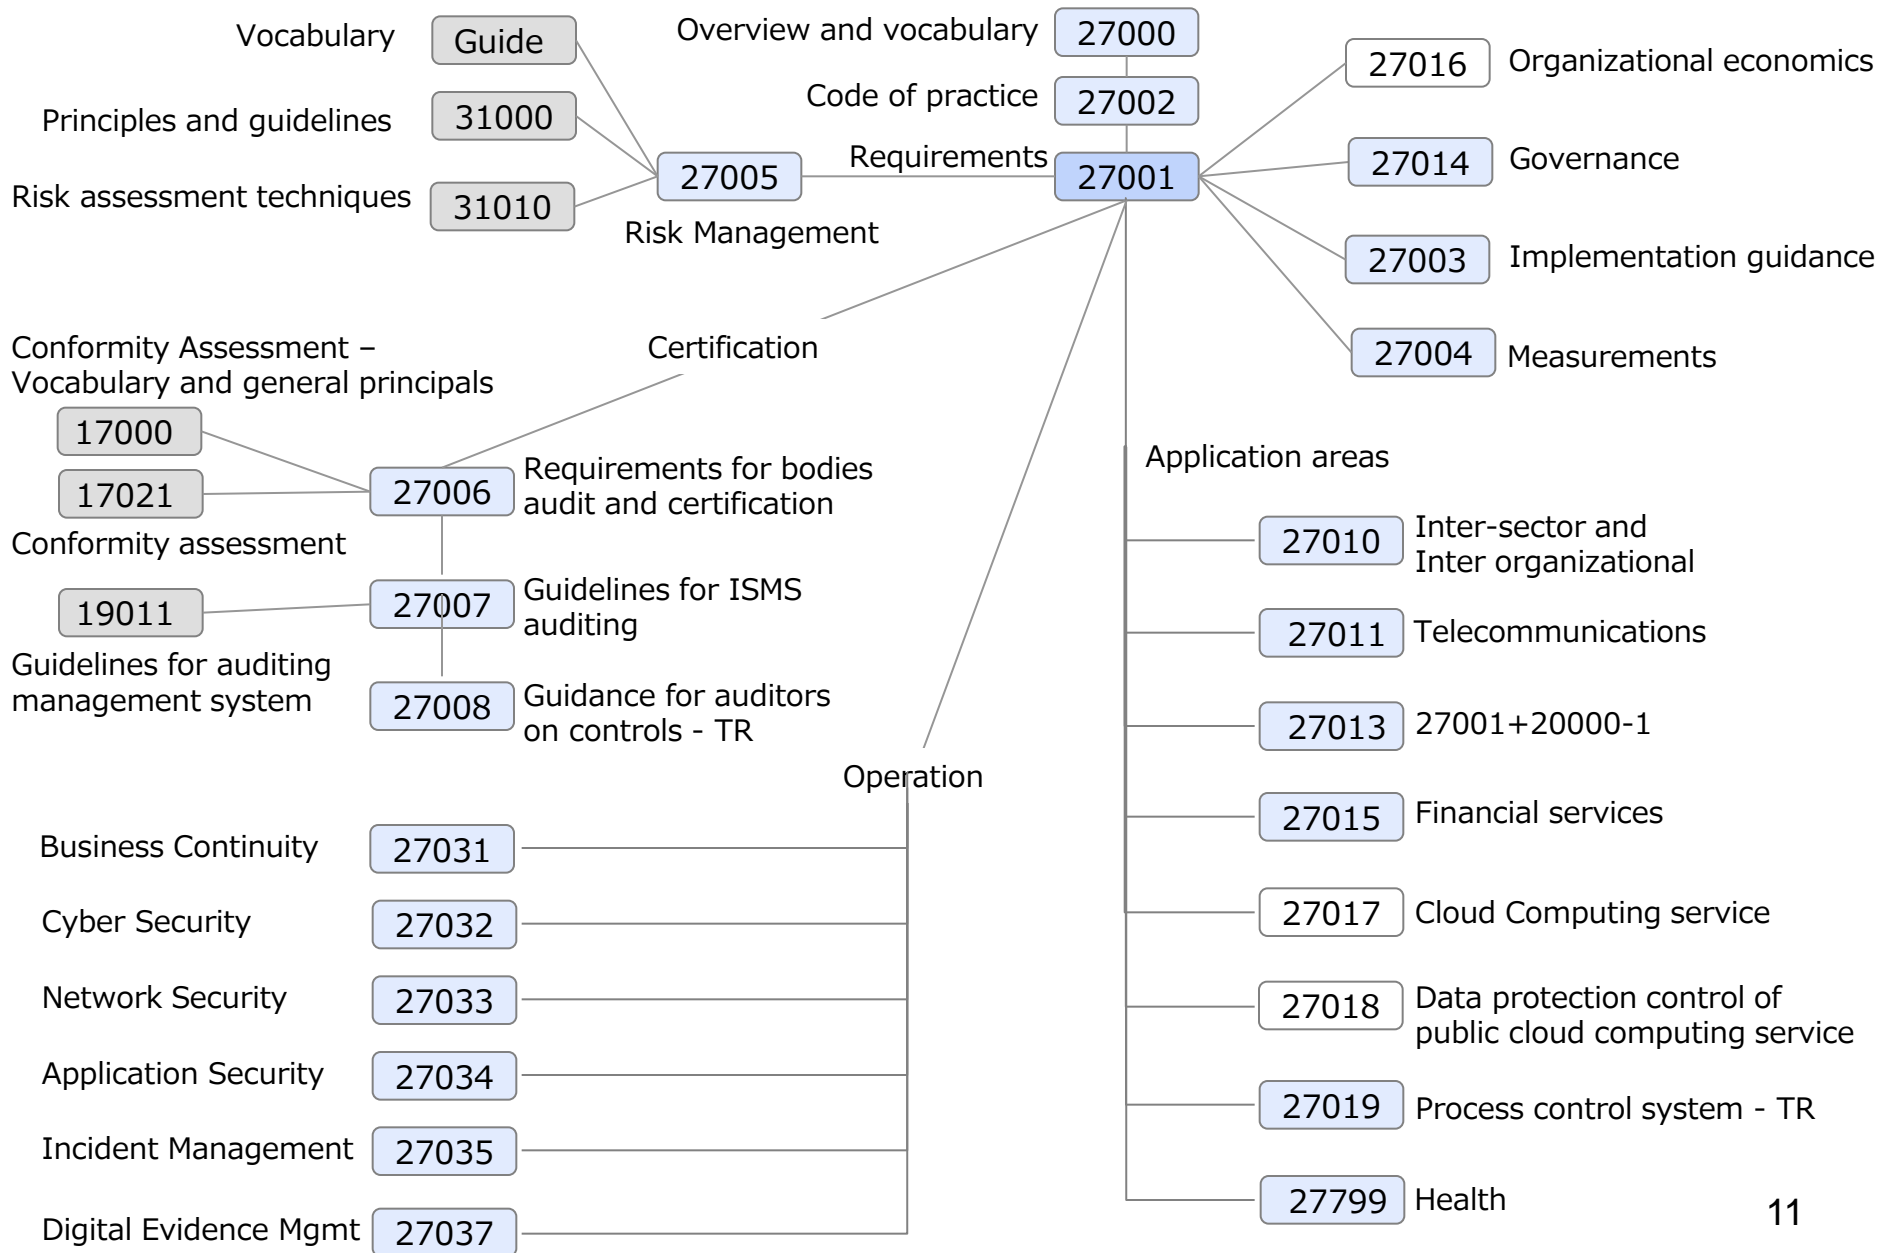

# Compliance: Following law and regulation

- Law and regulation, e.g.
  - EU Data Protection Directive 1995, mandates privacy regulation in EU member countries
  - Norwegian “personopplysningsloven” (personal data law) (2000) mandates principles for collecting and processing personal data
  - It is mandatory to follow laws and regulation,
  - Breach of compliance is sanctioned by authority
- Explicit company policy
  - Defines who is authorized to do what
  - Defines appropriate use
  - It is good practice to follow company policy,
  - Breach of compliance is sanctioned by company
  - Can lead to liability if incidents result from breach of policy

# IS Management Standards

- ISO/IEC 27K security standards:
  - ISO: International Standards Organization
  - IEC: International Electro-technical Committee
  - ISO/IEC is correct, but people mostly refer to the standards as ISO...
  - ISO 27001: Information Security Management System (ISMS)
  - ISO 27002: Code of practice for information security management
  - + many more
  - ISO/IEC standards must be bought
- USA
  - NIST (National Institute for Standards and Technology) Special Publications, including SP800-12, SP800-14, SP800-18, SP800-26 and SP800-30, SP800-64
  - + many more
  - NIST standards are free

# ISO/IEC 27002– What is it?

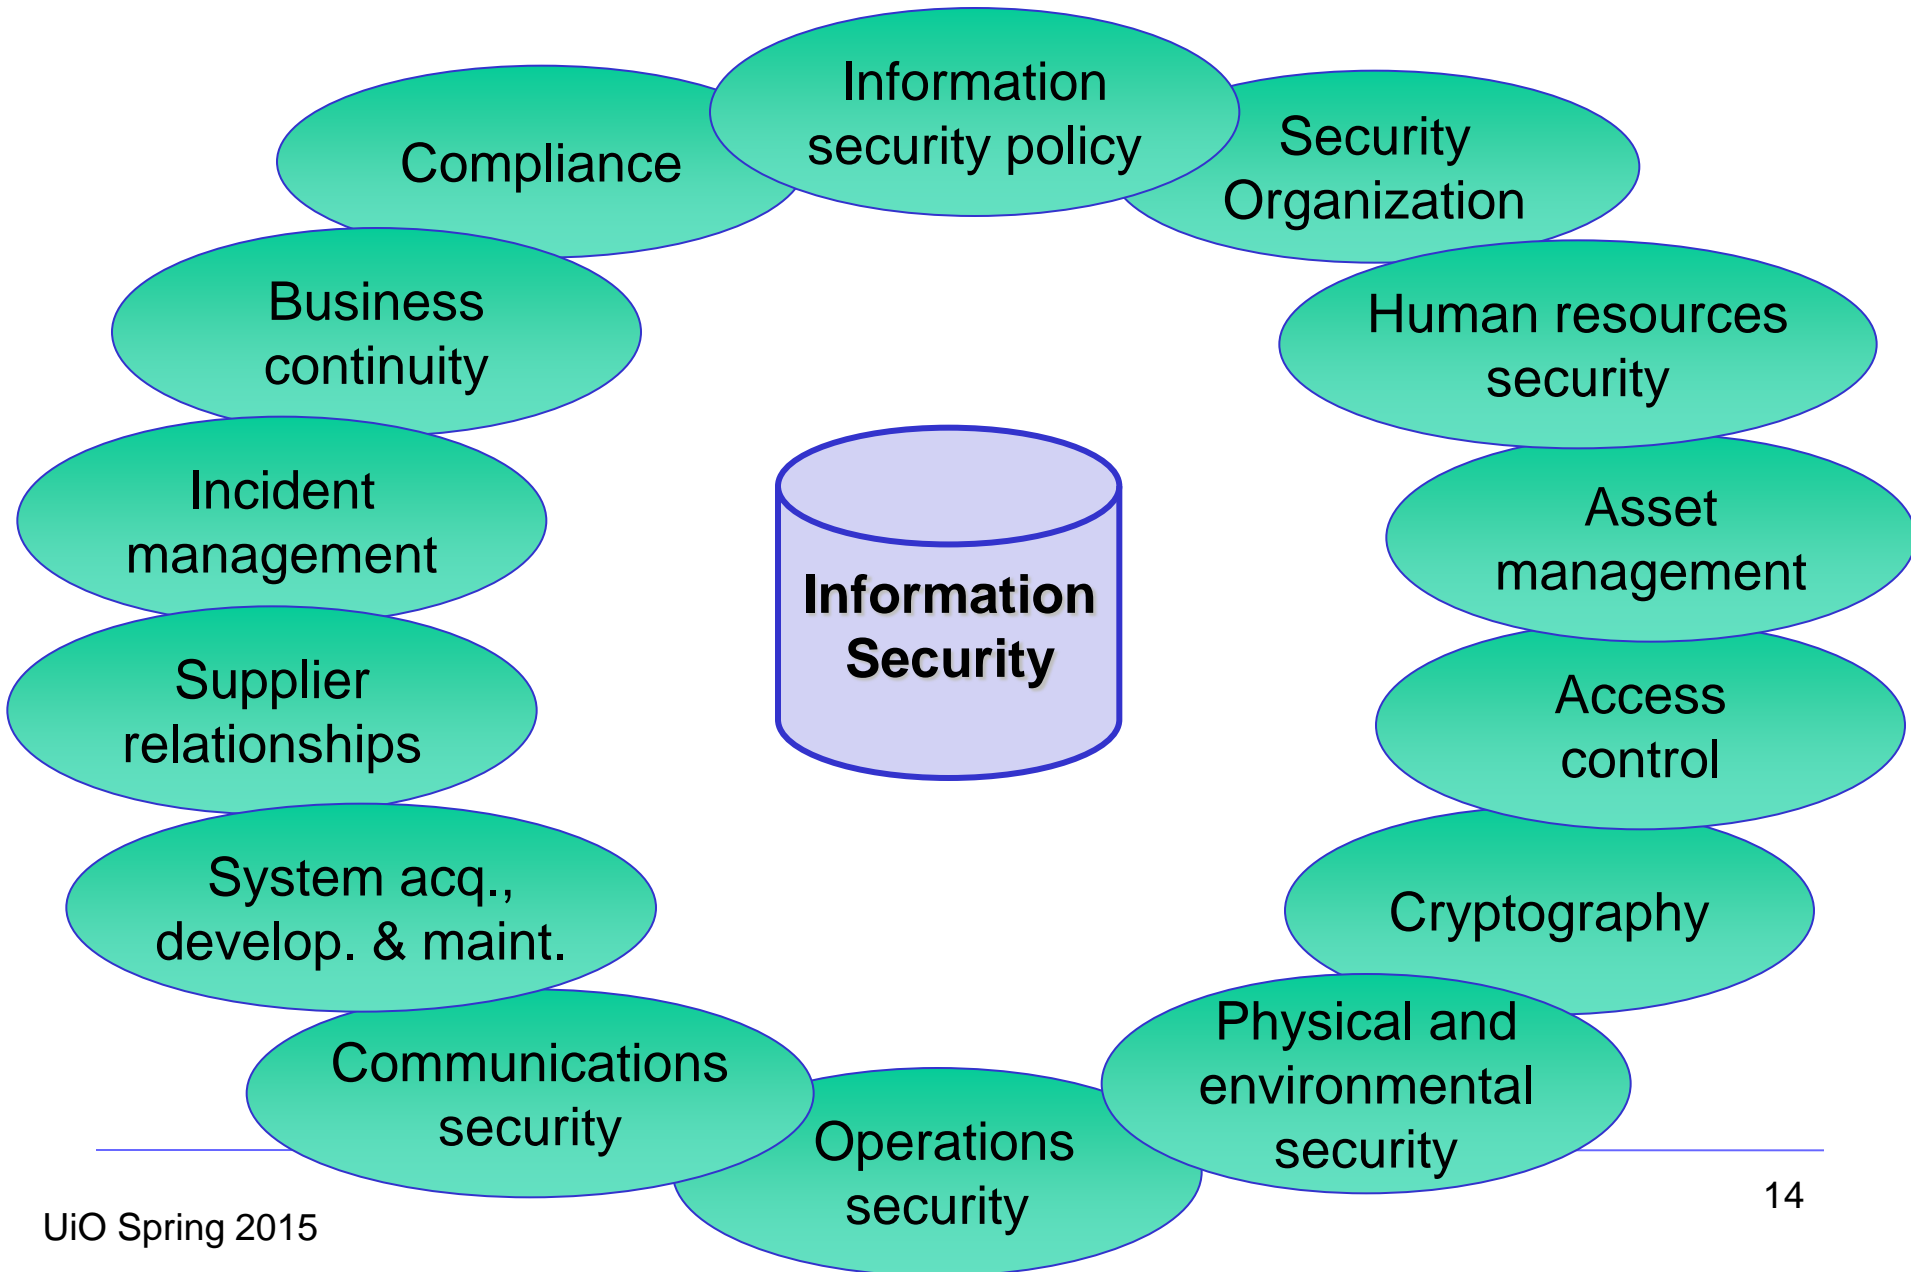

## Code of practice for information security management

- ISO 27002 provides a checklist of general security controls to be considered implemented/used in organizations
  - Contains 14 categories (control objectives) of security controls
  - Each category contains a set of security controls
  - In total, the standard describes 113 generic security controls
- Not all controls are relevant to every organisation
- Objective of ISO 27002:
- “... gives guidelines for [...] information security management practices including the selection, implementation and management of controls taking into consideration the organization’s information security risk environment(s).”

# ISO/IEC 27002 Code of Practice for ISM, History

- In early 1990's, recognized need for a practical guide for information security management
  - Group of leading companies in the UK combined to develop "*Code of Practice for Information Security Management*"
  - Published in the UK as BS7799 (British Standard) version 1 in Feb. 1995
  - New version adopted as ISO/IEC 17799:2001
  - Updated to ISO/IEC 27002:2005.
  - Last version ISO/IEC 27002:2013.

# The 14 Control Objectives of ISO/IEC 27002:2013

# ISO/IEC 27001:2013- What is it?

- ISO 27001 specifies requirements for establishing, implementing, maintaining and continually improving an information security management system (ISMS) within the context of the organization.
- ISMS is a holistic approach to IS management
  - ... not an IT system
- While the ISO 27002 (code of practice) defines a set of security goals and controls, ISO 27001 (ISMS) defines how to manage the implementation of security controls.
- Organizations can be certified against ISO 27001
  - ... but not against ISO 27002
- ISO 27001 is to be used in conjunction with ISO 27002

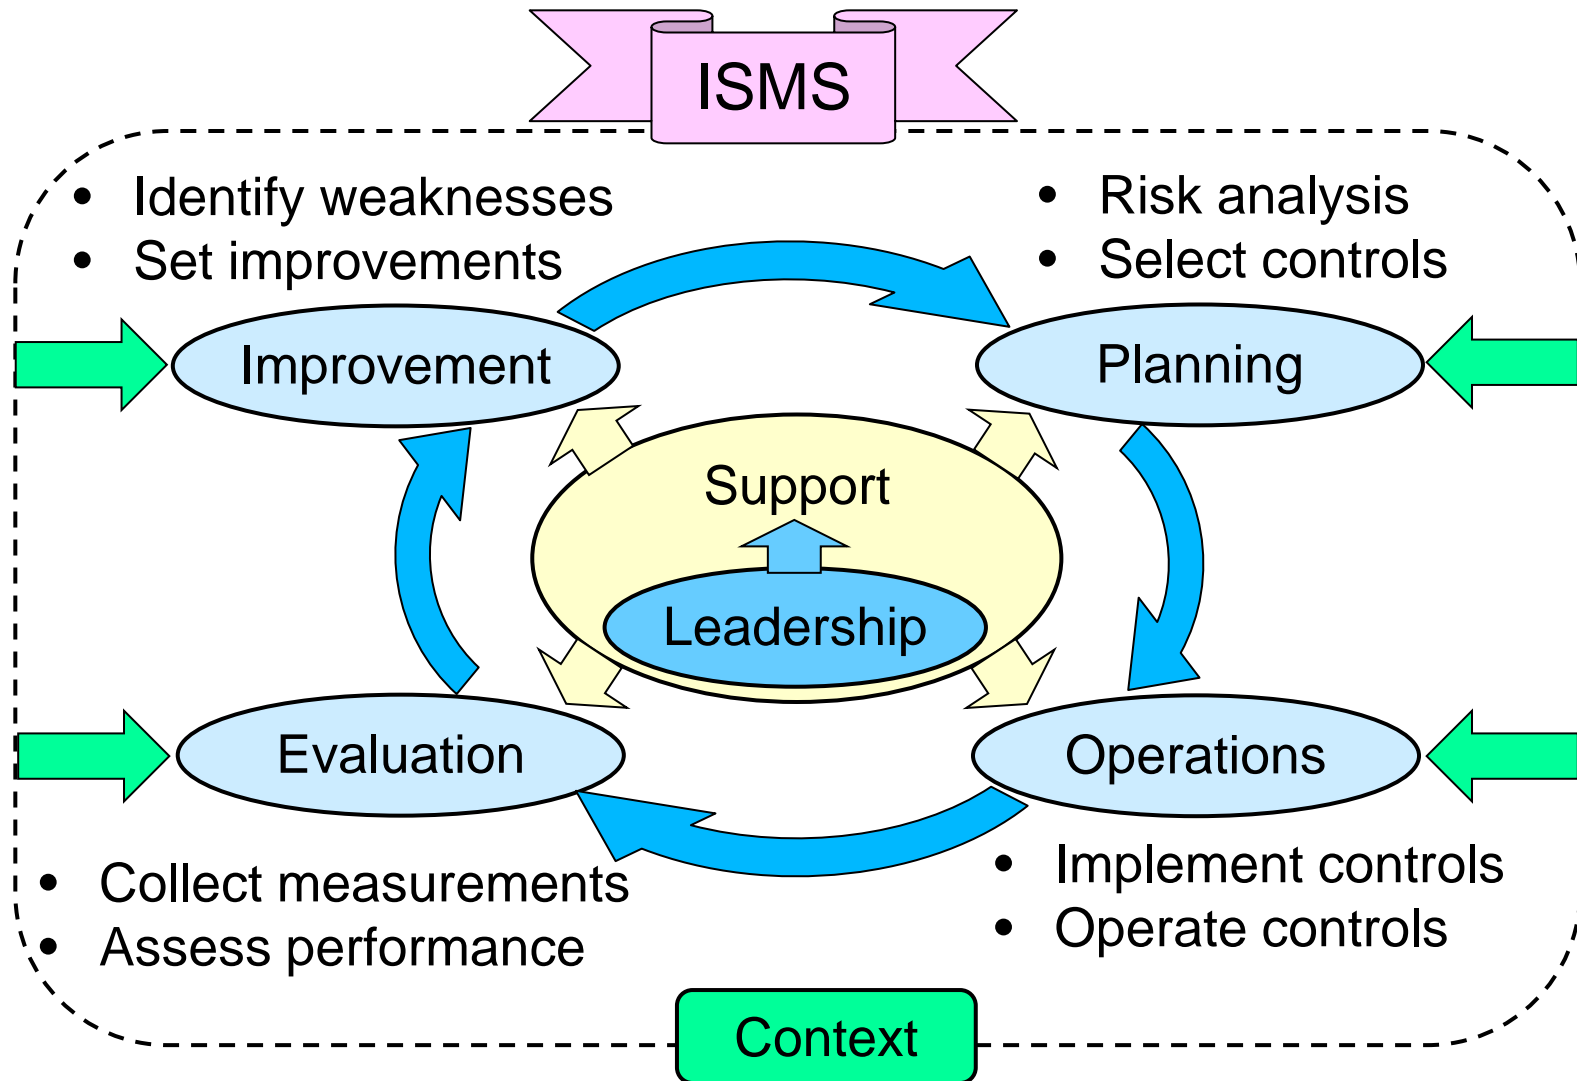

# ISO/IEC 27001- ISMS

## History

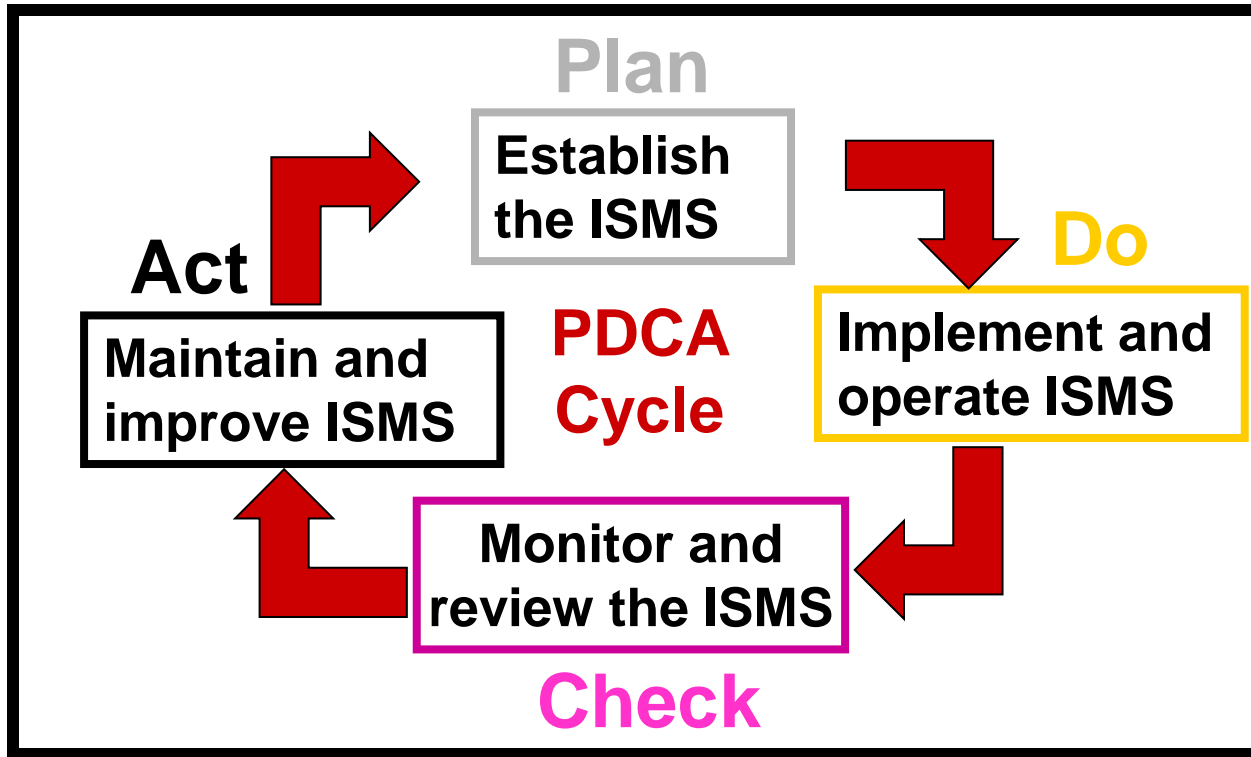

- The need to establish a certification scheme for information security management emerged late 1990s
- A general approach to security management was needed for certification purposes, not just the “code of practice”
- BS 7799-2:1999 was created to define a comprehensive **ISMS (Information Security Management System)** against which certification was possible.
- Led to the dramatic conclusion that **ISMS is perhaps of far greater and fundamental importance than the original Code of Practice.**
- ISMS which originally was a “part 2” of BS7799 became ISO 27001:2005, the main standard in the ISO 27K series
- Updated to ISO/IEC 27001:2013

# ISO 27001:2013 - ISMS Elements

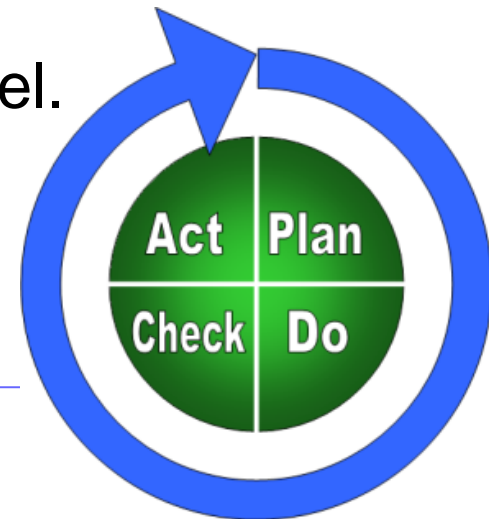

# Old ISMS model: PDCA

W. Edwards Deming  
(1900-1993)

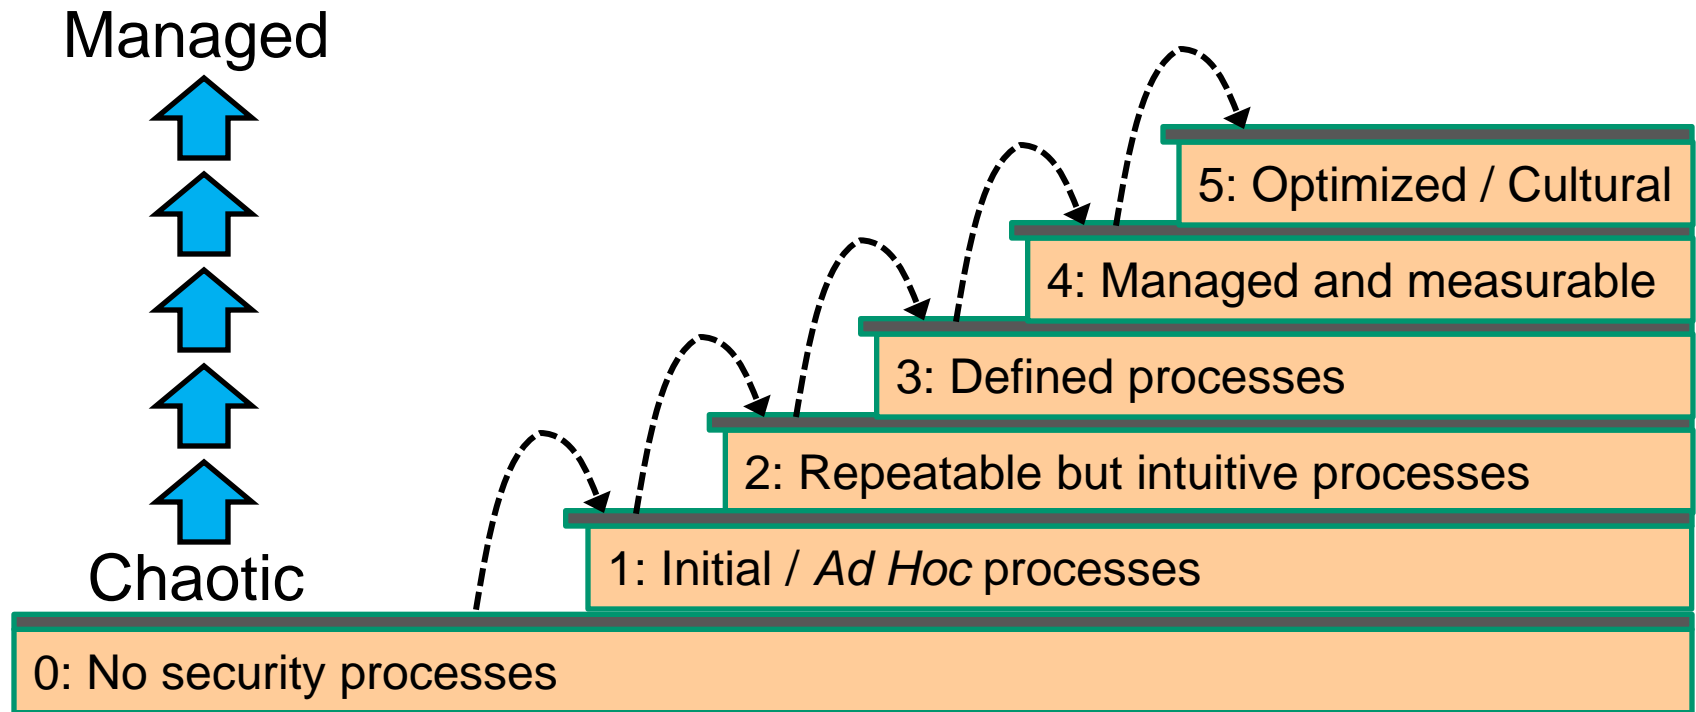

- Based on Deming's **PDCA** quality control model.
- ISO 27001:2013, ISMS no longer uses PDCA.
- Harris 6<sup>th</sup> edition still talks about PDCA.

# COBIT ISM CMM

## Capability Maturity Model for IS Management

Considerable effort and time is required to reach each next level in the maturity model.

# CMM levels 1 - 3

## 1. Initial / Ad Hoc

- + Processes are ad-hoc and disorganised.
- + Risks are considered on an ad hoc basis, but no formal processes exist.

## 2. Repeatable but intuitive

- + Processes follow a regular pattern.
- + Emerging understanding of risk and the need for security

## 3. Defined process

- + Processes are documented and communicated.
- + Company-wide risk management.'
- + Awareness of security and security policy

# CMM levels 4 - 5

## 4. Managed and measurable

- + Processes are monitored and measured.
- + Risks assessment standard procedures
- + Roles and responsibilities are assigned
- + Policies and standards are in place

## 5. Optimized

- + Security culture permeates organisation
- + Organisation-wide security processes are implemented, monitored and followed

Library of freely available SP800-X publications

- 100: Information Security Handbook: A Guide for Managers
- 53: Recommended Security Controls for Federal Info Systems
- 35: Guide to Information Technology Security Services
- 39: Managing Information Security Risk
- 30: Guide for Conducting Risk Assessment
- 27: Engineering Principles for Information Technology Security
- 18: Guide for Developing Security Plans for Federal Info Systems
- 14: Generally Accepted Principles and Practices for Securing Information Technology Systems
- 12: An Introduction to Computer Security: The NIST Handbook
- 26: Security Self-Assessment Guide for Information Technology Systems

# 20 CSC: Critical Security Controls

- 20 CSC is a practical description of the top 20 security controls recommended by experts for effective information security management in organisations.
- <http://www.counciloncybersecurity.org/critical-controls/>
- Regularly updated, last version is 5.1 published 2014.
- Alternative to ISO27002.
- Can be combined with ISO27001.
- Published by the Council on CyberSecurity, established in 2013 as an independent, expert, not-for-profit organization with a global scope committed to the security of an open Internet.

**COUNCIL ON  
CYBERSECURITY**  
LE CONSEIL DE LA CYBERSÉCURITÉ

# Evaluation of the ISMS through Security Measurements

- What is the effectiveness of a security control ?
  - You have to measure it to know it.
- Security measurements provide
  - info about how well security controls work
  - basis for comparing effect of controls on risks
  - benchmark for assessing security investments

# Why do we care: Example

- **The CEO asks,** *“Is our network perimeter secure?”*
- **Without metrics:**  
*“Well, we installed a firewall, so it must be.”*
- **With metrics:**  
*“Yes, our evidence tells us that we are. Look at our intrusion statistics before and after we completed that firewall project. It’s down 80%. We are definitely more secure today than we were before.”*

# What is a security measure ?

- Variable to which is assigned the result of a security measurement
- Security measurement is the process of obtaining information about the effectiveness of ISMS and controls using a measurement method
- Although standard security measures exist, security measures should ideally be adjusted and tuned to fit a specific organization's needs.

# Data types

- Quantitative data

- Nominal labels: A, B, C, etc.; IP ports and addresses.
- Ordinal data: Rank 1,2,3, etc.; Memory addresses
- Interval data: Distance, Range
- Quantity data: How much, or how many
- Proportion data: quantity / reference quantity

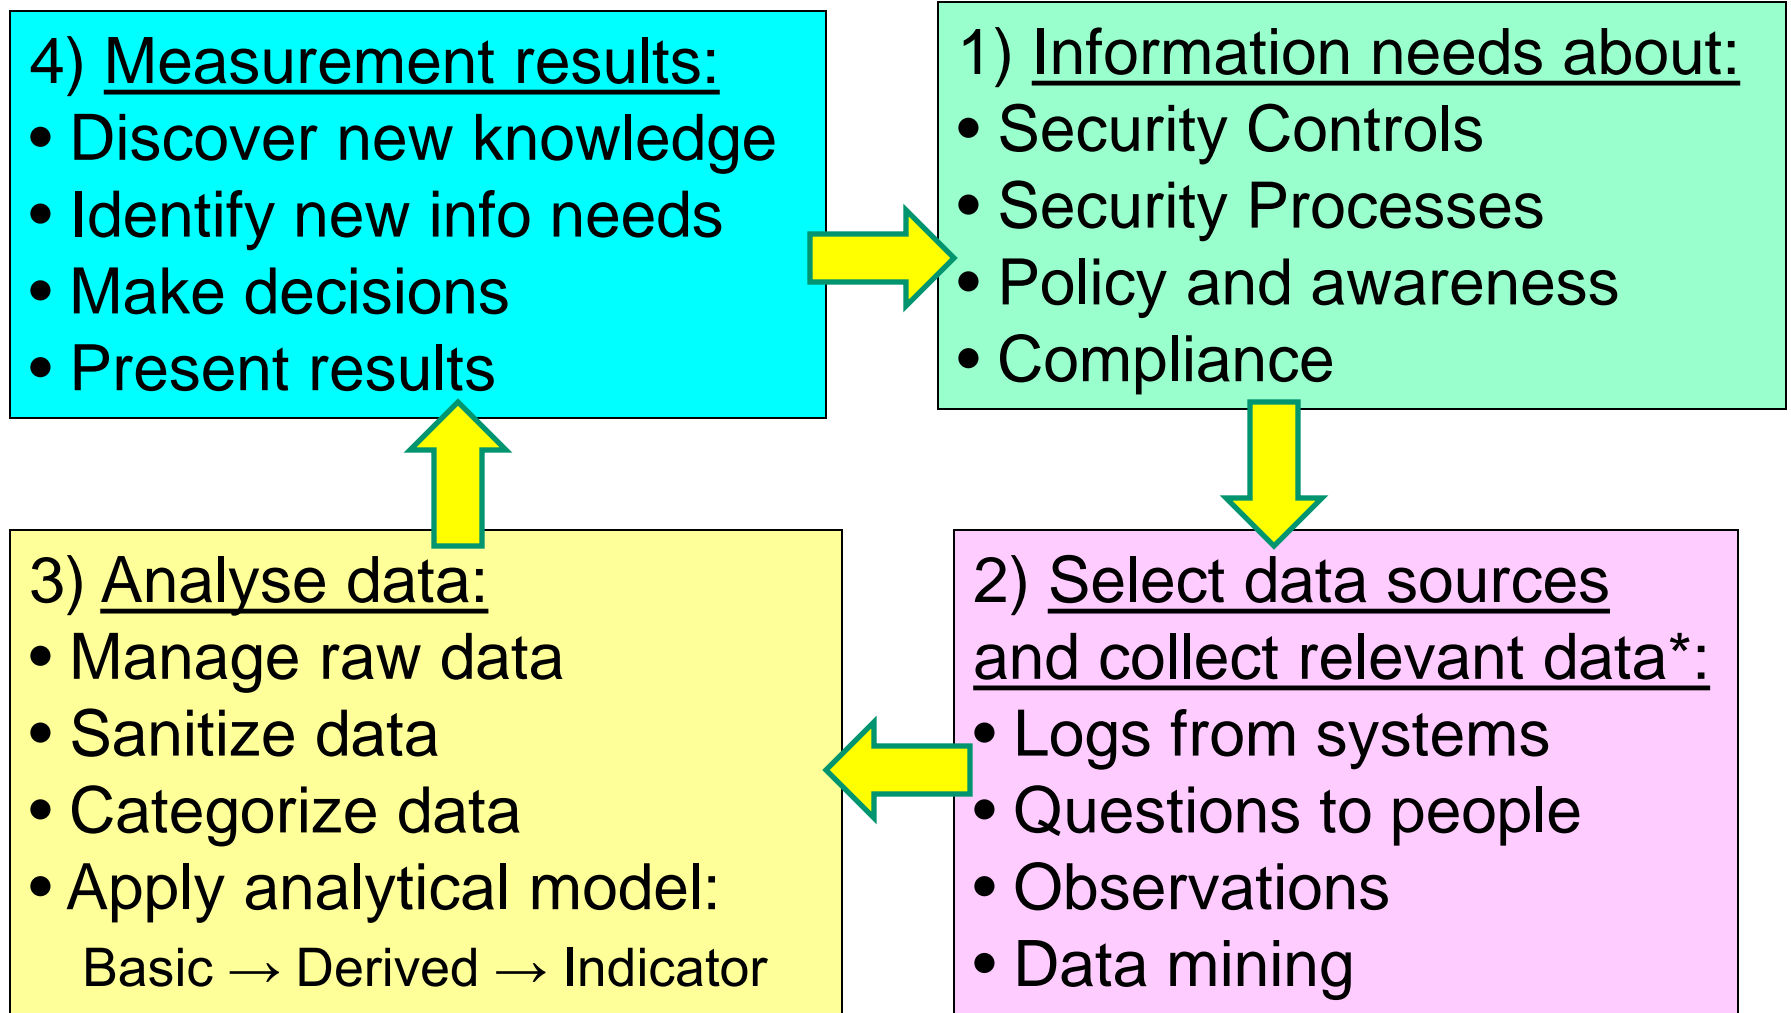

- Qualitative data

- Text
- Statements
- Categories
- Multimedia

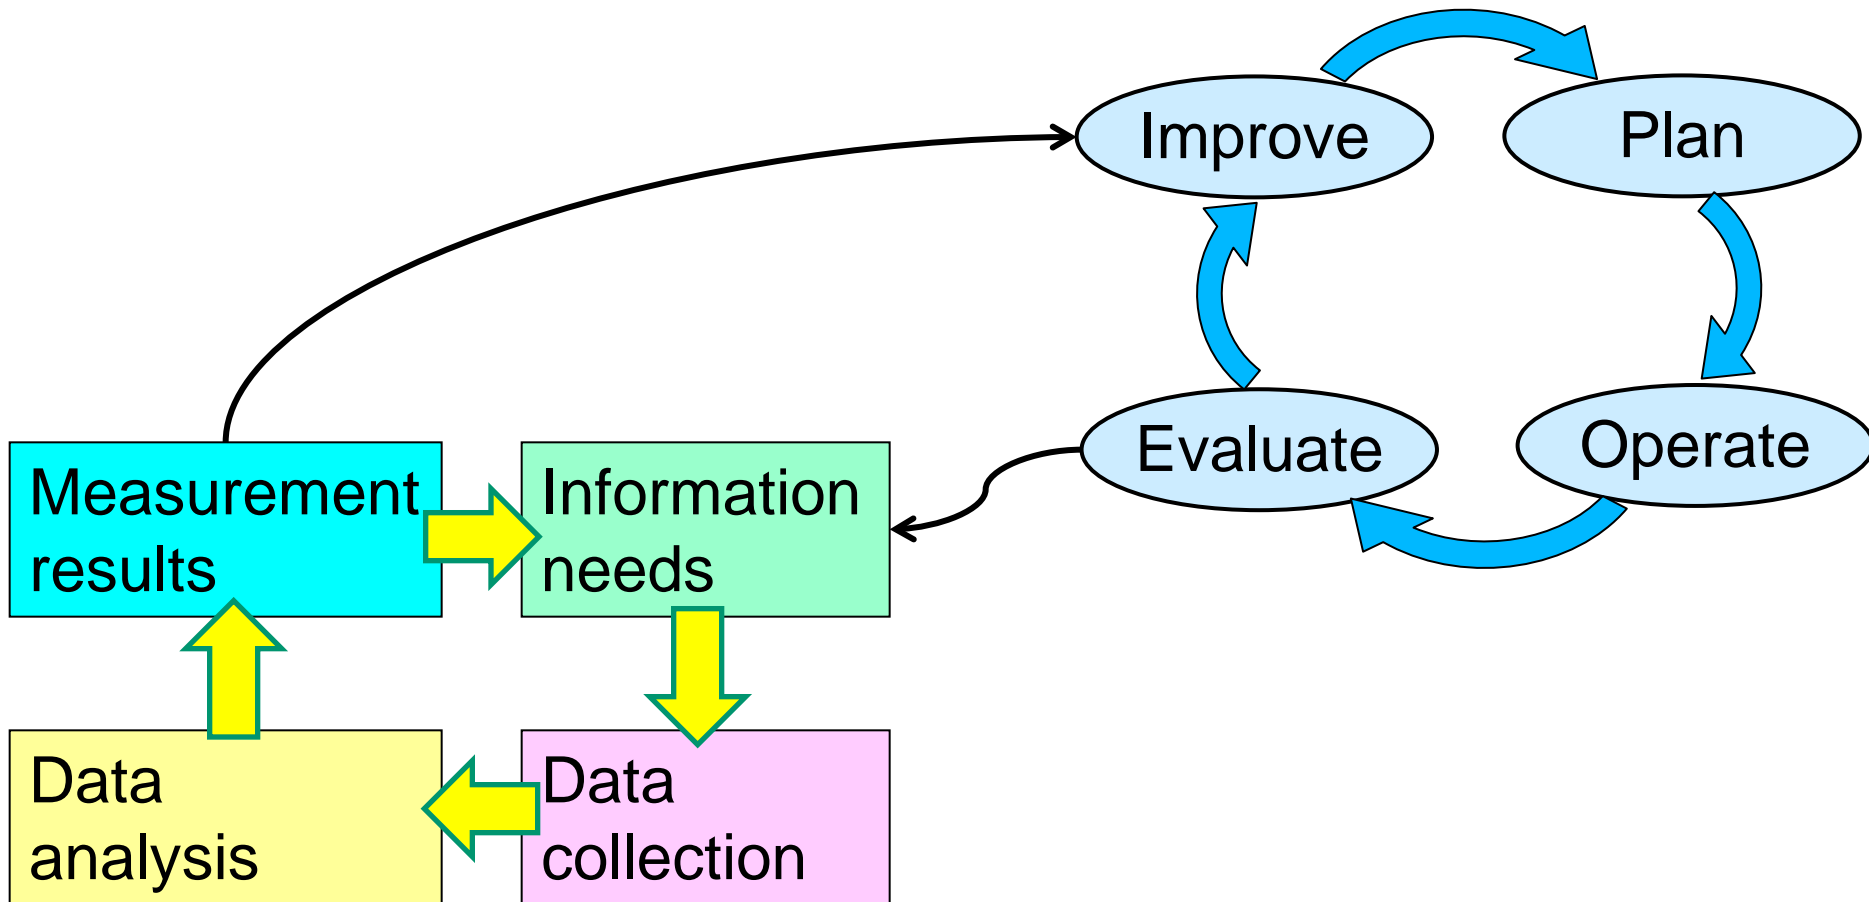

# IS Measurement Model (ISO 27004)

\*) Called Objects of measurement in ISO 27004

# Measurement – ISMS integration

# The human factor in information security

## ❖ Personnel integrity

- ❖ Making sure personnel do not become attackers

## ❖ Personnel as defence

- ❖ Making sure personnel do not fall victim to social engineering attacks

## ❖ Security usability

- ❖ Making sure users operate security correctly

# Personnel Integrity

## Preventing employees from becoming attackers

- Consider:
  - Employees
  - Executives
  - Customers
  - Visitors
  - Contractors & Consultants
- All these groups obtain some form of access privileges
- How to make sure privileges are not abused?

# Personnel crime statistics

- Organisations report that large proportion of computer crimes originate from inside
- US Statistics (CSI/FBI) 2005
  - <http://www.cpppe.umd.edu/Bookstore/Documents/2005CSISurvey.pdf>
  - 71% had inside (65% had external) computer crime attacks
- Australian Statistics (AusCERT) 2006
  - <http://www.auscert.org.au/images/ACCSS2006.pdf>
  - 30% had inside (82% had external) electronic attacks
- Norway: Mørketallsundersøkelsen 2012
  - <http://www.nsr-org.no/moerketall/>
  - Approx. 50% of attackers are either staff or consultants.

# Strengthening employee integrity

- Difficult to determine long term integrity of staff at hiring
  - Integrity can change, influenced by events
- All personnel should follow security awareness training
- Reminders about security policy and warnings about consequences of intentional breach of policy
  - Will strengthen power of judgment
- Personnel in highly trusted positions must be supported, trained and monitored
- Support and monitor employees in particular situations
  - Conflict, loss or change of job, personal problems
  - Stay on good terms with staff leaving the company

# Personnel Departure

- Different reasons for departure
  - Voluntary
  - Redundancy
  - Termination
- Different types of actions
  - Former employee may keep some privileges
  - Revoke all privileges
  - Escort to the exit.
- During exit interview, terms of original employment agreement reviewed (i.e. non-compete, wrongful disclosure, etc.)

# Social engineering attacks

Where people are the defence

# Social Engineering Attacks

- According to Kevin Mitnick:
  - “The biggest threat to the security of a company is not a computer virus, an unpatched hole in a program, or a badly installed firewall. In fact the biggest threat could be you.”
  - “What I found personally to be true was that it’s easier to manipulate people rather than technology. Most of the time, organisations overlook that human element”.

From “How to hack people”, BBC NewsOnline, 14 Oct 2002

# SE Tactics: Develop Trust

- People are naturally helpful and trusting
- Ask during seemingly innocent conversations
- Slowly ask for increasingly important information
- Learn company lingo, names of key personnel, names of servers and applications
- Cause a problem and subsequently offer your help to fix it (aka. reverse social engineering)
- Talk negatively about common enemy
- Talk positively about common hero

# SE Tactics: Induce strong affect

- Heightened emotional state makes victim
  - Less alert
  - Less likely to analyse deceptive arguments
- Triggered by attacker by creating
  - Excitement (“you have won a price”)
  - Fear (“you will lose your job”)
  - Confusion (contradictory statements)

# SE Tactics: Information overload

- Reduced the target's ability to scrutinize arguments proposed by the attacker
- Triggered by
  - Providing large amounts of information to produce sensory overload
  - Providing arguments from an unexpected angle, which forces the victim to analyse the situation from new perspective, which requires additional mental processing

# SE Tactics: Reciprocation

- Exploits our tendency to return a favour
  - Even if the first favour was not requested
  - Even if the return favour is more valuable
- Double disagreement
  - If the attacker creates a double disagreement, and gives in on one, the victim will have a tendency to give in on the other
- Expectation
  - If the victim is requested to give the first favour, he will believe that the attacker becomes a future ally

# SE Tactics:

## Diffusion of responsibility and moral duty

- Make the target feel the he or she will not be held responsible for actions
- Make the target feel that satisfying attacker's request is a moral duty

# SE Tactics: Authority

- People are conditioned to obey authority
  - Milgram and other experiments
  - Considered rude to even challenge the veracity of authority claim
- Triggered by
  - Faking credentials
  - Faking to be a director or superior
  - Skilful acting (con artist)

# SE Tactics: Commitment creep

- People have a tendency to follow commitments, even when recognising that it might be unwise.
- It's often a matter of showing personal consistency and integrity
- Triggered e.g. by creating a situation where one commitment naturally or logically follows another.
  - First request is harmless
  - Second request causes the damage

# Multi-Level Defence against Social Engineering Attacks

Source: David Gragg: <http://www.sans.org/rr/whitepapers/engineering/>

# SE Defence: Foundation

- The security policy must address SE attacks
  - Policy is always the foundation of information security
    - Address e.g.: Shredding, Escorting, Authority obedience
- Ban practice that is similar to social attack patterns
  - Asking for passwords over phone is a typical SE attack method
    - Therefore never provide passwords over the phone
  - Calling a user and pretending to represent IT department is a typical SE attack
    - Therefore never call user, or make it possible/mandatory for user to authenticate the IT Department
  - Calling IT dep. and pretending to be user is a typical SE attack
    - Therefore make it possible/mandatory for IT department to authenticate the user

# SE Defence: Awareness

- Security awareness training for all staff
  - Understanding SE tactics
  - Learn to recognise SE attacks
  - Know when to say “no”
  - Know what is sensitive
  - Understand their responsibility
  - Understand the danger of casual conversation
  - Friends are not always friends
  - Passwords are personal
  - Uniforms are cheap
- Awareness of policy shall make personnel feel that the only choice is to resist SE attempts

# SE Defence: Fortress

- Resistance training for key personnel
  - Consider: Reception, Help desk, Sys.Admin., Customer service,
- Fortress training techniques
  - Inoculation
    - Expose to SE arguments, and learn counterarguments
  - Forewarming
    - of content and intent
  - Reality check:
    - Realising own vulnerability,

# SE Defence: Persistence

- Ongoing reminders
  - SE resistance will quickly diminish after a training session
  - Repeated training
  - Reminding staff of SE dangers
    - Posters
    - Messages
    - Tests

# SE Defence: Gotcha

- Social Engineering Detectors
  - Filters and traps designed to expose SE attackers
- Consider:
  - The justified Know-it-all
    - Person who knows everybody
  - Centralised log of suspicious events
    - Can help discover SE patterns
  - Call backs mandatory by policy
  - Key questions, e.g. personal details
  - “Please hold” mandatory by policy
    - Time to think and log event
  - Deception
    - Bogus question
    - Login + password of “alarm account” on yellow sticker

# SE Defence: Offensive

- Incident response
  - Well defined process for reporting and reacting to
    - Possible SE attack events,
    - Cases of successful SE attacks
- Reaction should be vigilant and aggressive
  - Go after SE attacker
  - Proactively warn other potential victims

# Security awareness training

- Back up and protection of work related information
- Passwords
- Email and web hygiene and acceptable use
- Recognising social engineers
- Recognising and reporting security incidents
- Responsibilities and duties for security
- Consequences of negligence or misbehaviour
- Security principles for system and business processes

# Security Usability

# Kerckhoffs - 1883

## The father of security usability

- Auguste Kerckhoffs. La cryptographie militaire. Journal des sciences militaires, IX(38):5-38, 1883.
- Most famous for “*avoid security by obscurity*”
- Also defined security usability principles

*It must be easy to communicate and remember the keys without requiring written notes, it must also be easy to change or modify the keys with different participants.*

*Finally, regarding the circumstances in which such a system is applied, it must be easy to use and must neither require stress of mind nor the knowledge of a long series of rules.*

# Security Learning

- Good metaphors are important for learning
- Many security concepts do not have intuitive metaphors
- Better avoid metaphors than use bad ones
- Define new security concepts
  - and give them semantic content
- Security learning design
  - Design systems to facilitate good security learning
  - Largely unexplored field

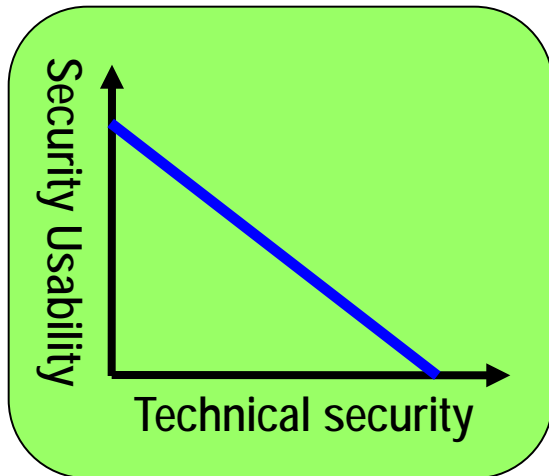

# Stages of security learning

## Revealing a deeper problem

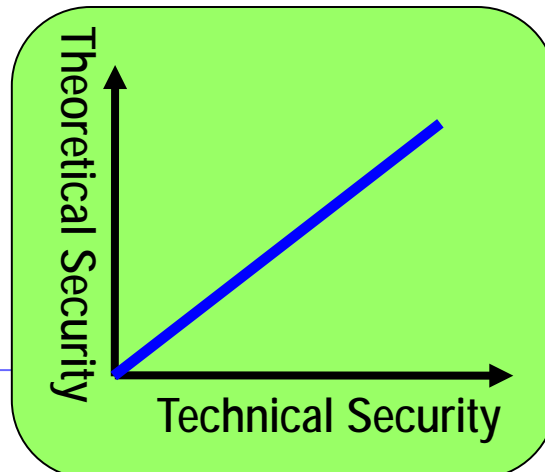

# Security/Usability trade-off

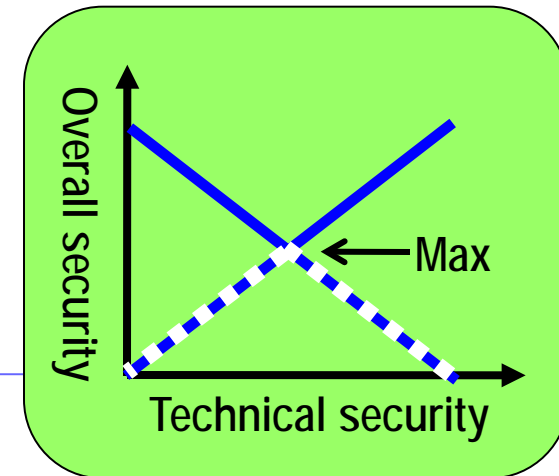

1. Trade-off between technical security and usability.
2. Goal is to increase both usability and technical security.
3. Find the right amount of technical security to maximize overall security

+

=

# Security usability vulnerabilities

Security usability vulnerabilities exist when:

- users don't know or understand which security decisions or actions are required,
- systems do not provide the user with sufficient information for deriving a security conclusion,
- an intolerable mental or manual load results from deriving the required security conclusion,
- an intolerable mental or manual load results from deriving security concl. for any practical # of instances.

A.Jøsang *et al.* (ACSAC'07)

Security Usability Principles for Vulnerability Analysis and Risk Assessment

# Remarks on security usability

- Security usability is difficult to get right
  - Not the same as IT usability
- Security can never be 100% transparent
  - Security learning is a challenge
- Security decisions often made without basis
  - Better security decision support is needed
- Knowledge about security usability exists
  - User-friendly security can be designed

# OffPAD project

## Behavioral Biometrics User Experiment

- Students with an Android smartphone can participate
- Go to the OffPAD website: [www.offpad.org](http://www.offpad.org)
- Select DowloadS (private)
- login: `test_offpad`
- password: `Offpad_ensicaen_test_2014`
- Click on each icon to download and install the apps.
- Please don't forget to send the logs of your input.

Thank you for participating !
