## <u>Lecture 4</u> Cryptography

University of Oslo, spring 2016 Leif Nilsen

### **Outline**

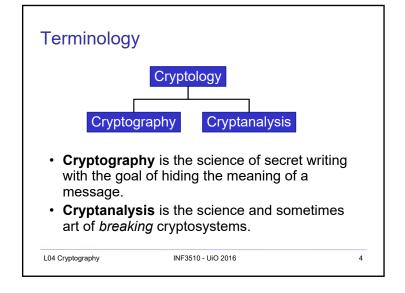

- · What is cryptography?
- · Brief crypto history
- · Security issues
- Symmetric cryptography
  - Stream ciphers
  - Block ciphers
  - Hash functions
- · Asymmetric cryptography
  - Factoring based mechanisms
  - Discrete Logarithms
  - Digital signatures

### Taxonomy of cryptographic primitives

## Caesar cipher

### **Example: Caesar cipher**

P = {abcdefghijklmnopqrstuvwxyz}
C = {DEFGHIJKLMNOPQRSTUVWXYZABC}

Plaintext: kryptologi er et spennende fag Chiphertext: NUBSWRORJL HU HT VSHQQHQGH IDJ

Note: Caesar chipher in this form does not include a variable key, but is an instance of a "shift-cipher" using key K = 3.

INF3510 - UiO 2016

L04 Cryptography

# Model of symmetric cryptosystem Oscar Decryptor Bab Secure channel INF3510 - UiO 2016 6

### Numerical encoding of the alphabet

Using this encoding many classical crypto systems can be expressed as algebraic functions over  $\mathbb{Z}_{26}$  (English alphabet) or  $\mathbb{Z}_{29}$  (Norwegian alphabet)

L04 Cryptography

INF3510 - UiO 2016

### Shift cipher

Let 
$$\mathcal{P} = C = \mathbb{Z}_{29}$$
. For  $0 \le K \le 28$ , we define  $E(x, K) = x + K \pmod{29}$  and  $D(y, K) = y - K \pmod{29}$ 

 $(x, y \in \mathbb{Z}_{29})$ 

Question: What is the size of the key space?

Puzzle: ct =

LAHYCXPAJYQHRBWNNMNMOXABNLDANLXVVDWRLJCRXWB Find the plaintext!

•

L04 Cryptography

INF3510 - UiO 2016

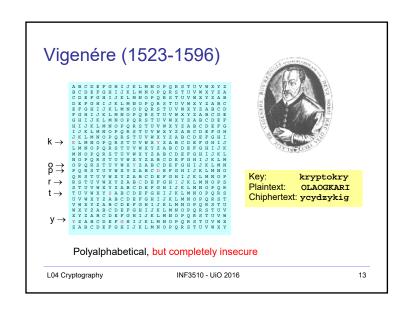

### Lessons learned

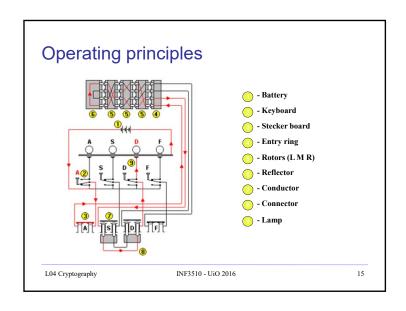

- A cipher with a small keyspace can easily be attacked by exhaustive search
- A large keyspace is necessary for a secure cipher, but it is by itself not sufficient
- Monoalphabetical substitution ciphers can easily be broken

L04 Cryptography

INF3510 - UiO 2016

L04 Cryptography

INF3510 - UiO 2016

# Brute-Force Attack (or Exhaustive Key Search)

- Treats the cipher as a black box
- Requires (at least) 1 plaintext-ciphertext pair  $(x_0, y_0)$
- Check all possible keys until condition is fulfilled:

$$d_{\kappa}(y_0) = x_0$$

· How many keys to we need?

Key length in bit	Key space	Security life time (assuming brute-force as best possible attack)
64	264	Short term (few days or less)
128	2128	Long-term (several decades in the absence of quantum computers)
256	2256	Long-term (also resistant against quantum computers – note that QC do not exist at the moment and might never exist)

L04 Cryptography

INF3510 - UiO 2016

### Kerckhoff's principles

23

- The system should be, if not theoretically unbreakable, unbreakable in practice.
- The design of a system should not require secrecy and compromise of the system should not inconvenience the correspondents (Kerckhoffs' principle).
- The key should be rememberable without notes and should be easily changeable
- The cryptograms should be transmittable by telegraph
- The apparatus or documents should be portable and operable by a single person
- The system should be easy, neither requiring knowledge of a long list of rules nor involving mental strain

L04 Cryptography INF3510 - UiO 2016 21

### Does secure ciphers exist?

- What is a secure cipher?
  - Perfect security
  - Computational security
  - Provable security

L04 Cryptography

INF3510 - UiO 2016

### Attack models:

Known ciphertext

Known plaintext

Chosen plaintext (adaptive)

Chosen ciphertext (adaptive)

### What are the goals of the attacker?

- Find the secret plaintext or part of the plaintext
- Find the encryption key
- Distinguish the encryption of two different plaintexts

### How clever is the attacker?

L04 Cryptography

INF3510 - UiO 2016

22

A perfect secure crypto system

Vernam one-time pad (1918)
Frank Miller (1882)  $c_i = p_i \oplus k_i$   $p_i = c_i \oplus k_i = p_i \oplus k_i \oplus k_i = p_i$ Note:  $a \oplus b = a + b \pmod{2}$ Offers perfect security assuming the key is perfectly random, of same length as The Message; and only used once. Proved by Claude E. Shannon in 1949.

L04 Cryptography

### Symmetric encryption

Is it possible to design secure and practical crypto?

INF3510 - UiO 2016

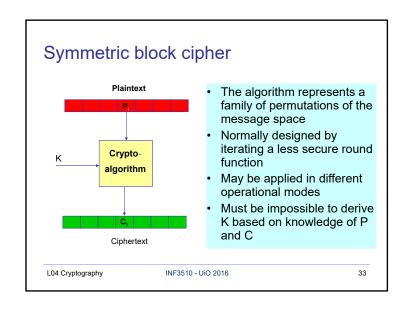

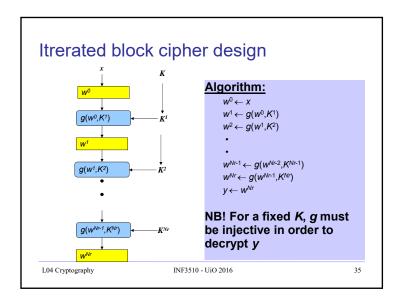

### LFSR - properties

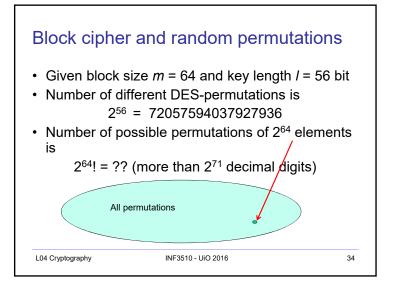

- Easy to implement in HW, offers fast clocking
- The output sequence is completely determined of the initial state and the feedback coefficients
- Using "correct" feedback a register of length n may generate a sequence with period 2<sup>n</sup>-1
- The sequence will provide good statistical properties
- Knowing 2n consecutive bits of the key stream, will reveal the initial state and feedback
- The linearity means that a single LFSR is completely useless as a stream cipher, but LFSRs may be a useful building block for the design of a strong stream cipher

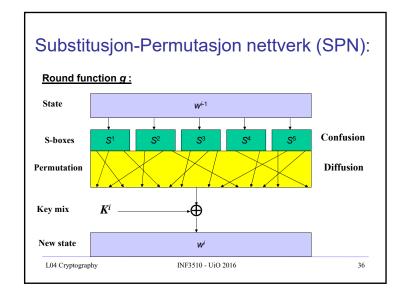

L04 Cryptography

INF3510 - UiO 2016

### **Data Encryption Standard**

- Published in 1977 by the US National Bureau of Standards for use in unclassified government applications with a 15 year life time.
- 16 round Feistel cipher with 64-bit data blocks, 56-bit keys.
- 56-bit keys were controversial in 1977; today, exhaustive search on 56-bit keys is very feasible.
- Controversial because of classified design criteria, however no loop hole was ever found.

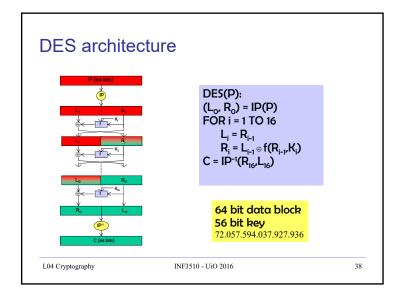

L04 Cryptography INF3510 - UiO 2016 37

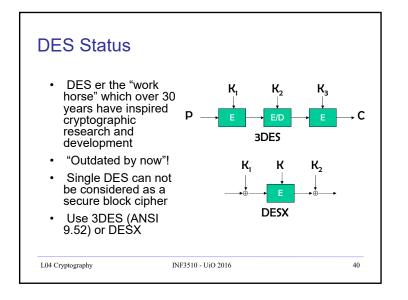

### **EFF DES-cracker**

- Dedicated ASIC with 24 DES search engines
- 27 PCBs housing 1800 circuits
- Can test 92 billion keys per second
- Cost 250 000 \$
- DES key found July 1998 after 56 hours search
- Combined effort DES Cracker and 100.000 PCs could test 245 billion keys per second and found key after 22 hours

L04 Cryptography INF

INF3510 - UiO 2016

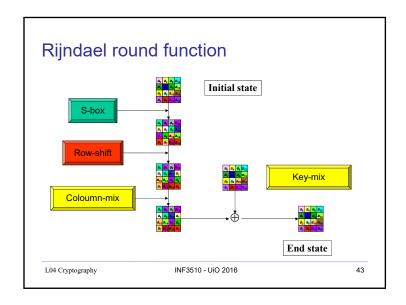

### **Advanced Encryption Standard**

- Public competition to replace DES: because 56bit keys and 64-bit data blocks no longer adequate.
- Rijndael nominated as the new Advanced Encryption Standard (AES) in 2001 [FIPS-197].
- Rijndael (pronounce as "Rhine-doll") designed by Vincent Rijmen and Joan Daemen.
- 128-bit block size (Note error in Harris p. 809)
- 128-bit, 196-bit, and 256-bit key sizes.
- Rijndael is not a Feistel cipher.

L04 Cryptography INF3510 - UiO 2016 41

### Rijndael, the selected AES cipher

Designed by Vincent Rijmen and Joan Daemen from Belgium

L04 Cryptography

INF3510 - UiO 2016

42

### Rijndael encryption

- 1. Key mix (round key  $K_0$ )
- 2.  $N_r$ -1 rounds containing:
  - a) Byte substitution
  - b) Row shift
  - c) Coloumn mix
  - d) Key mix (round key  $K_i$ )
- 3. Last round containing:
  - a) Byte substitution
  - b) Row shift
  - c) Key mix (round key  $K_{N_r}$ )

Key	Rounds
128	10
192	12
256	14

L04 Cryptography

INF3510 - UiO 2016

### **Block Ciphers: Modes of Operation**

- Block ciphers can be used in different modes in order to provide different security services.
- Common modes include:
  - Electronic Code Book (ECB)
  - Cipher Block Chaining (CBC)
  - Output Feedback (OFB)
  - Cipher Feedback (CFB)
  - Counter Mode (CTR)
  - Galois Counter Mode (GCM) {Authenticated encryption}

L04 Cryptography

INF3510 - UiO 2016

45

47

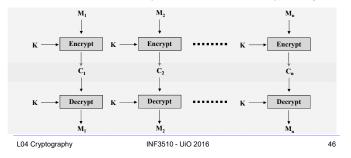

### **ECB Mode**

- ECB Mode Issues
  - Problem: For a given key, the same plaintext block always encrypts to the same ciphertext block.
    - This may allow an attacker to construct a code book of known plaintext/ciphertext blocks.
    - The attacker could use this codebook to insert, delete, reorder or replay data blocks within the data stream without detection
  - Other modes of operation can prevent this, by not encrypting blocks independently
    - For example, using the output of one block encryption as input to the next (chaining)

L04 Cryptography INF3510 - UiO 2016

### **Electronic Code Book**

- ECB Mode encryption
  - Simplest mode of operation
  - Plaintext data is divided into blocks  $M_1, M_2, ..., M_n$
  - Each block is then processed separately
    - Plaintext block and key used as inputs to the encryption algorithm

Plaintext

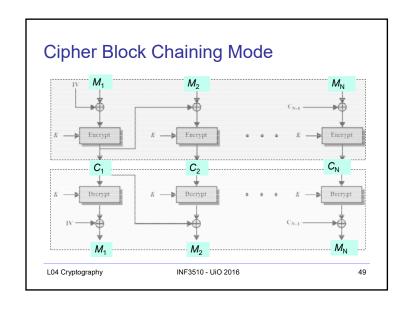

Ciphertext using ECB mode

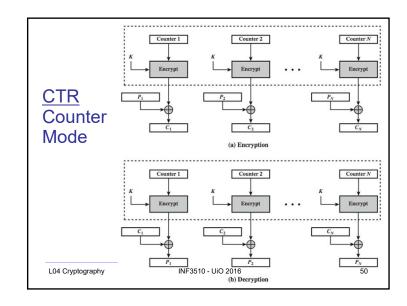

Ciphertext using secure mode

L04 Cryptography

INF3510 - UiO 2016

### Applications of hash functions

- · Protection of password
- · Comparing files
- Authentication of SW distributions
- Bitcoin
- Generation of Message Authentication Codes (MAC)
- Digital signatures
- Pseudo number generation/Mask generation functions
- Key derivation

L04 Cryptography

INF3510 - UiO 2016

E2

### 

### Hash functions (message digest functions)

Requirements for a one-way hash function *h*:

- 1. Ease of computation: given x, it is easy to compute h(x).
- 2. Compression: h maps inputs x of arbitrary bitlength to outputs h(x) of a fixed bitlength n.
- 3. One-way: given a value y, it is computationally infeasible to find an input x so that h(x)=y.
- 4. Collision resistance: it is computationally infeasible to find x and x', where  $x \neq x'$ , with h(x)=h(x') (note: two variants of this property).

L04 Cryptography

INF3510 - UiO 2016

54

### Frequently used hash functions

- MD5: 128 bit digest. Broken. Often used in Internet protocols but no longer recommended.
- SHA-1 (Secure Hash Algorithm):160 bit digest. Potential attacks exist. Designed to operate with the US Digital Signature Standard (DSA);
- SHA-256, 384, 512 bit digest. Still secure. Replacement for SHA-1
- RIPEMD-160: 160 bit digest. Still secure. Hash function frequently used by European cryptographic service providers.
- NIST competition for new secure hash algorithm, announcement of winner in 2012.

L04 Cryptography

INF3510 - UiO 2016

### And the winner is?

- NIST announced Keccak as the winner of the SHA-3 Cryptographic Hash Algorithm Competition on October 2, 2012, and ended the five-year competition.
- Keccak was designed by a team of cryptographers from Belgium and Italy, they are:
  - Guido Bertoni (Italy) of STMicroelectronics,
  - Joan Daemen (Belgium) of STMicroelectronics,
  - Michaël Peeters (Belgium) of NXP Semiconductors, and
  - Gilles Van Assche (Belgium) of STMicroelectronics.

L04 Cryptography

INF3510 - UiO 2016

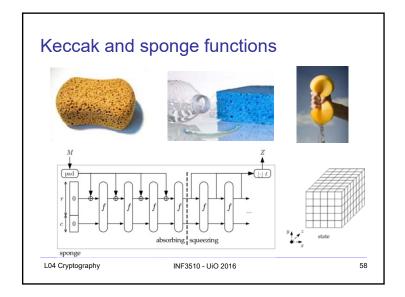

57

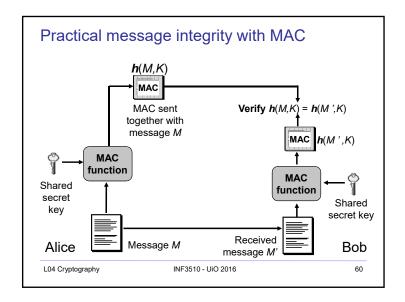

### MAC and MAC algorithms

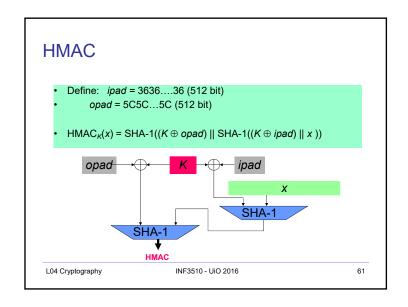

- MAC means two things:
  - 1. The computed message authentication code h(M, k)
  - 2. General name for algorithms used to compute a MAC
- In practice, the MAC algorithm is e.g.
  - HMAC (Hash-based MAC algorithm))
  - CBC-MAC (CBC based MAC algorithm)
  - CMAC (Cipher-based MAC algorithm)
- MAC algorithms, a.k.a. keyed hash functions, support data origin authentication services.

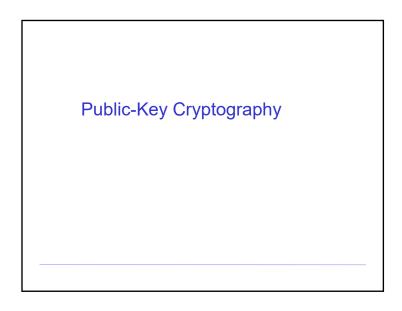

L04 Cryptography

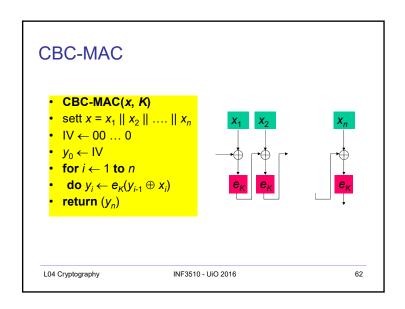

INF3510 - UiO 2016

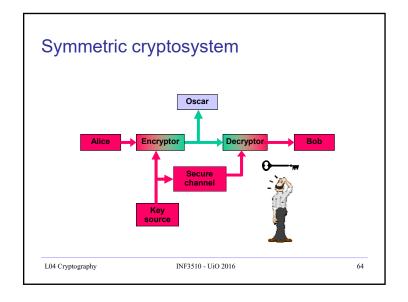

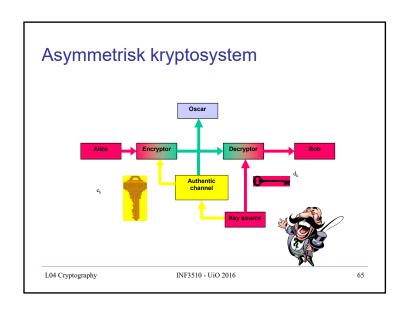

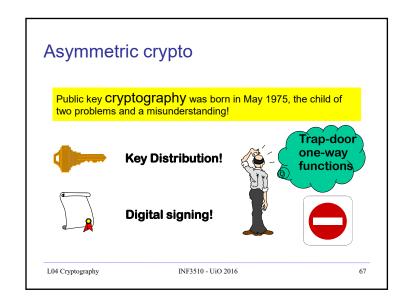

### Public key inventors?

Marty Hellman and Whit Diffie, Stanford 1976

R. Rivest, A. Shamir and L. Adleman, MIT 1978

James Ellis, CESG 1970

C. Cocks, M. Williamson, CESG 1973-1974

INF3510 - UiO 2016 L04 Cryptography

### One-way functions

### Modular power function

Given n = pq, where p and q are prime numbers. No efficient algoritms to find p and q. Chose a positive integer *b* and define  $f: \mathbb{Z}_n \to \mathbb{Z}_n$  $f(x) = x^b \mod n$ 

### Modular exponentiation

Given prime p, generator g and a modular power  $a = g^x \pmod{p}$ . No efficient algoritms to find  $x. f: \mathbb{Z}_p \to \mathbb{Z}_p$  $f(x) = g^x \mod p$ 

L04 Cryptography

INF3510 - UiO 2016

### Diffie-Hellman key agreement (key exchange) (provides no authentication)

Alice picks random integer a

 $g^a \mod p$ 

Bob picks random integer b

 $g^b \mod p$ 

Computationally impossible to compute discrete logarithm

Alice computes the shared secret

 $(g^b)^a = g^{ab} \mod p$ 

Bob computes the same

 $(g^a)^b = g^{ab} \mod p$ .

L04 Cryptography

INF3510 - UiO 2016

71

### Example (2)

### RSA parametre (textbook version)

- Bob generates two large prime numbers p and q and computes  $n = p \cdot q$ .
- He then computes a public encryption exponent e, such that
- (e, (p-1)(q-1))) = 1 and computes the corresponding decryption exsponent d, by solving:

$$d \cdot e \equiv 1 \pmod{(p-1)(q-1)}$$

 Bob's public key is the pair P<sub>B</sub> = (e, n) and the corresponding private and secret key is S<sub>B</sub> = (d, n).

> Encryption:  $C = M^e \pmod{n}$ Decryption:  $M = C^d \pmod{n}$

### Ron Rivest, Adi Shamir and Len Adleman

- Read about public-key cryptography in 1976 article by Diffie & Hellman: "New directions in cryptography"
- Intrigued, they worked on finding a practical algorithm
- Spent several months in 1976 to re-invent the method for non-secret/public-key encryption discovered by Clifford Cocks 3 years earlier
- Named RSA algorithm

### RSA toy example

- Set p = 157, q = 223. Then  $n = p \cdot q = 157 \cdot 223 = 35011$  and  $(p-1)(q-1) = 156 \cdot 222 = 34632$
- Set encryption exponent: e = 14213 {gcd(34632,14213) = 1}
- Public key: (14213, 35011)
- Compute:  $d = e^{-1} = 14213^{-1} \pmod{34632} = 31613$
- Private key: (31613, 35011)
- Encryption:
- Plaintext M = 19726, then C = 19726<sup>14213</sup> (mod 35011) = 32986
- · Decryption:
- Cipherertext C = 32986, then M = 32986<sup>31613</sup>(mod 35011) = 19726

### Asymmetric Ciphers: Examples of Cryptosystems

- · RSA: best known asymmetric algorithm.
  - RSA = Rivest, Shamir, and Adleman (published 1977)
  - Historical Note: U.K. cryptographer Clifford Cocks invented the same algorithm in 1973, but didn't publish.
- ElGamal Cryptosystem
  - Based on the difficulty of solving the discrete log problem.
- Elliptic Curve Cryptography
  - Based on the difficulty of solving the EC discrete log problem.
  - Provides same level of security with smaller key sizes.

L04 Cryptography INF3510 - UiO 2016

### Computational effort?

- Factoring using NFS-algorithm (Number Field Sieve)
- 6 mnd using 80 cores to find suitable polynomial
- Solding from August 2007 to April 2009 (1500 AMD64-år)
- 192 796 550 \* 192 795 550 matrise (105 GB)
- 119 days on 8 different clusters
- Corresponds to 2000 years processing on one single core 2.2GHz AMD Opteron (ca. 2<sup>67</sup> instructions)

### Elliptic curves

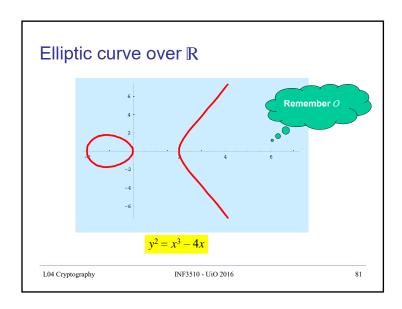

Let p > 3 be a prime. An elliptic curve y² = x³ + ax + b over GF(p) = Z<sub>p</sub> consist of all solutions (x, y) ∈ Z<sub>p</sub> × Z<sub>p</sub> to the equation

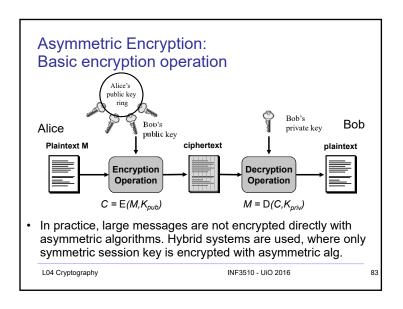

$$y^2 \equiv x^3 + ax + b \pmod{p}$$

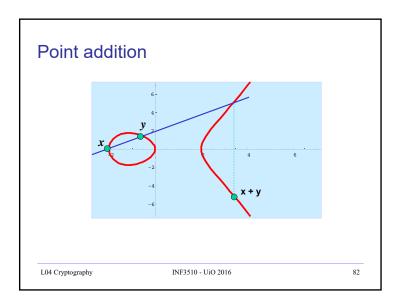

where a, b ∈ Z<sub>p</sub> are constants such that 4a<sup>3</sup> + 27b<sup>2</sup> ≠ 0 (mod p), together with a special point O which is denoted as the point at infinity.

INF3510 - UiO 2016

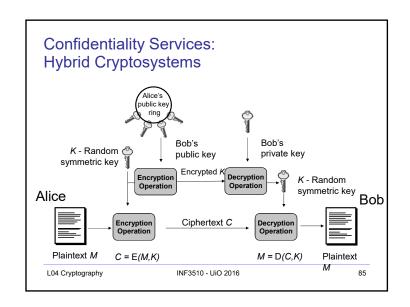

### **Hybrid Cryptosystems**

- Symmetric ciphers are faster than asymmetric ciphers (because they are less computationally expensive), but ...
- Asymmetric ciphers simplify key distribution, therefore ...
- a combination of both symmetric and asymmetric ciphers can be used a hybrid system:
  - The asymmetric cipher is used to distribute a randomly chosen symmetric key.
  - The symmetric cipher is used for encrypting bulk data.

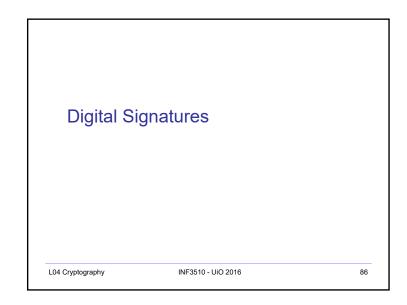

L04 Cryptography INF3510 - UiO 2016 84

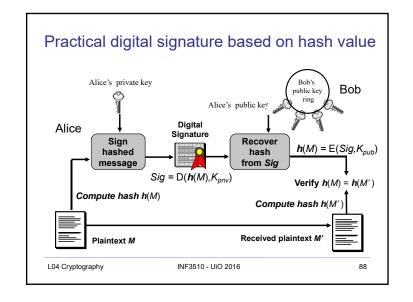

### **Digital Signature Mechanisms**

- A MAC cannot be used as evidence that should be verified by a third party.
- Digital signatures used for non-repudiation, data origin authentication and data integrity services, and in some authentication exchange mechanisms.
- Digital signature mechanisms have three components:
  - key generation
  - signing procedure (private)
  - verification procedure (public)
- Algorithms
  - RSA
  - DSA and ECDSA

L04 Cryptography INF3510 - UiO 2016

### **Digital Signatures**

- To get an authentication service that links a document to A's name (identity) and not just a verification key, we require a procedure for B to get an authentic copy of A's public key.
- Only then do we have a service that proves the authenticity of documents 'signed by A'.
- This can be provided by a PKI (Public Key Infrastructure)
- Yet even such a service does not provide nonrepudiation at the level of persons.

L04 Cryptography INF3510 - UiO 2016 89

### Key length comparison:

Symmetric and Asymmetric ciphers offering comparable security

AES Key Size	RSA Key Size	Elliptic curve Key Size
-	1024	163
128	3072	256
192	7680	384
256	15360	512

L04 Cryptography 91

### Difference between MACs & Dig. Sig.

 MACs and digital signatures are both authentication mechanisms.

- MAC: the verifier needs the secret that was used to compute the MAC; thus a MAC is unsuitable as evidence with a third party.
- The third party does not have the secret.
- The third party cannot distinguish between the parties knowing the secret.

 Digital signatures can be validated by third parties, and can in theory thereby support both non-repudiation and authentication.

L04 Cryptography INF3510 - UiO 2016

### Another look at key lengths

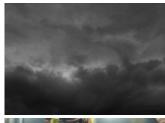

Table 1. Intuitive security levels.

security level	volume of water	symmetric	cryptographic	RSA modulus	
security level	to bring to a boil	key	hash	ROA modulus	
teaspoon security	0.0025 liter	35	70	242	
shower security	80 liter	50	100	453	
pool security	2500000 liter	65	130	745	
rain security	$0.082  \mathrm{km^3}$	80	160	1130	
lake security	$89  \mathrm{km}^3$	90	180	1440	
sea security	$3750000  \mathrm{km^3}$	105	210	1990	
global security	$1400000000\mathrm{km^3}$	114	228	2380	
solar security	-	140	280	3730	

L04 Cryptography

# Clouds in the (crypto) horizon

- If a large quantum computer can be built, the security of most asymmetric schemes is broken!
- Current research is focused to develop efficient asymmetric algorithms that cannot be broken by QC!
