# INF3580 - Semantic Technologies - Spring 2010 Lecture 10: OWL, the Web Ontology Language

Martin G. Skjæveland

29th March 2011

# Oblig 4

- Oblig 4 will be published on the course webpage after today's lecture.
- RDFS, Semantics, Semantic Web, OWL.
- First attempt: 11th April.
- More details in the oblig.

### From the Administration

- Norgesuniversitetet is doing a survey on how digital media should be used at universities.
- Have your say at

http://synovate.no/iktmonitorstudent

before this Friday.

Win an iPad.

- Two delivery attempts.

Reminder: RDFS

### Outline

- Reminder: RDFS
- 2 Description Logics
- Introduction to OWL

#### Reminder: RDFS

# The RDFS vocabulary

- RDFS adds the concept of "classes" which are like *types* or *sets* of resources.
- A predefined vocabulary allows statements about classes.
- Defined resources:
  - rdfs:Resource: The class of resources, everything,
  - rdfs:Class: The class of classes,
  - rdf:Property: The class of properties (from rdf).
- Defined properties:
  - rdf:type: relates resources to classes they are members of.
  - rdfs:domain: The domain of a relation.
  - rdfs:range: The range of a relation.
  - rdfs:subClassOf: Concept inclusion.
  - rdfs:subPropertyOf: Property inclusion.

NF3580 :: Spring 2010

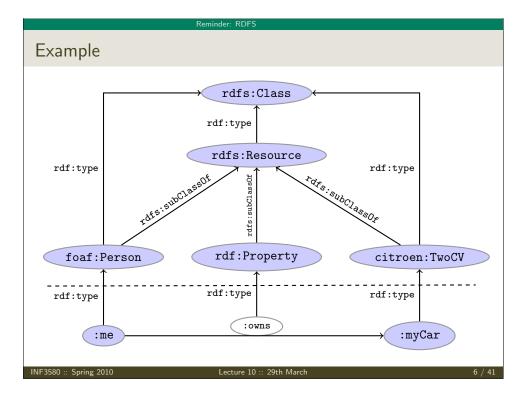

Lecture 10 :: 29th Marcl

5 / 1

Reminder: RDES

### Clear semantics

- RDFS has formal semantics.
- Entailment is a *mathematically* defined relationship between RDF(S) graphs. E.g.,
  - answers to SPARQL queries are well-defined, and
  - $\bullet\,$  the interpretation of blank nodes is clear.
- The semantics allows for rules to reason about classes and properties and membership.
- Using RDFS entailment rules we can infer:
  - type propagation
  - property inheritance, and
  - domain and range reasoning.

Reminder: R

# Yet, it's inexpressive

- RDFS does not allow for complex definitions, other than multiple inheritance.
- All RDFS graphs are satisfiable; we want to express negations also.
- RDFS semantics is quite weak.
  - E.g., reasoning about the domain and range of properties is not supported.

3580 ·· Spring 2010 | Lecture 10 ·· 20th March 7 / 41 | INF3580 ·· Spring 2010 | Lecture 10 ·· 20th March 8

Reminder: RDFS

# Modelling patterns

Common modelling patterns cannot be expressed properly in RDFS:

- X A person has a mother.
- X A penguin eats only fish. A horse eats only chocolate.
- X A nuclear family has two parents, at least two children and a dog.
- X A smoker is not a non-smoker (and vice versa).
- X Everybody loves Mary.
- X Adam is not Eve (and vice versa).
- X Everything is black or white.
- X There is no such thing as a free lunch.
- The brother of my father is my uncle.
- X My friend's friends are also my friends.
- X If Homer is married to Marge, then Marge is married to Homer.
- X If Homer is a parent of Bart, then Bart is a child of Homer.

NF3580 :: Spring 2010

Outline

Reminder: RDFS

2 Description Logics

Lecture 10 :: 29th Marc

0 / 1

# And it's complicated

In the standardised RDFS semantics (not our simplified version):

- No clear ontology/data boundary
  - No restrictions on the use of the built-ins.
  - Can have relations between classes and relations:

:myCar rdf:type citroen:TwoCV .
citroen:TwoCV rdf:type cars:ModelClass .

- Remember: in RDF, properties are resources,
- so they can be subject or object of triples.
- Well, in RDFS, classes are resources,
- so they can also be subject or object of triples.
- The RDFS entailment rules are incomplete.
  - Can't derive all statements that are semantically valid.

NF3580 :: Spring 2010

ecture 10 :: 29th March

10 / 4

# Make it simple!

- Keep classes, properties, individuals and relationships apart.
- "Data level" with individuals and relationships between them.
- "Ontology level" with properties and classes.
- Use a fixed vocabulary of built-ins for relations between classes and properties, and their members—and nothing else.
- Interpret
  - classes as sets of individuals, and
  - properties as relations between individuals, i.e., sets of pairs
  - —which is what do in our simplified semantics.
- A setting well-studied as *Description Logics*.

F3580 ·· Spring 2010 | Lecture 10 ·· 20th March | 11 / 41 | INF3580 ·· Spring 2010 | Lecture 10 ·· 20th March | 12 / 41

Description Logic

# The $\mathcal{ALC}$ Description Logic

### Vocabulary

Fix a set of atomic concepts A, roles R and individuals a, b.

### $\mathcal{ALC}$ concept descriptions

$$C, D o A$$
 | (atomic concept)  
 $op$  | (universal concept)  
 $op$  | (bottom concept)  
 $op C$  | (atomic negation)  
 $op C op D$  | (intersection)  
 $op C op D$  | (union)  
 $op C op D$  | (value restriction)  
 $op C op D$  | (value restriction)

#### Axioms

- $C \sqsubseteq D$  and  $C \equiv D$  for concept descriptions D and C.
- C(a) and R(a,b) for concept description C, role R and individuals a,b.

NF3580 :: Spring 2010

Lecture 10 :: 29th March

13 / 41

#### Description Logics

### ALC Semantics

#### Interpretation

An interpretation  $\mathcal I$  fixes a set  $\Delta^{\mathcal I}$ , the *domain*,  $A^{\mathcal I}\subseteq \Delta$  for each atomic concept  $A,\ R^{\mathcal I}\subseteq \Delta\times \Delta$  for each role R, and  $a^{\mathcal I}\in \Delta$  for each individual a.

#### Interpretation of concept descriptions

$$\begin{array}{rcl} \mathbb{T}^{\mathcal{I}} &=& \Delta^{\mathcal{I}} \\ \mathbb{L}^{\mathcal{I}} &=& \emptyset \\ (\neg C)^{\mathcal{I}} &=& \Delta^{\mathcal{I}} \setminus C^{\mathcal{I}} \\ (C \sqcap D)^{\mathcal{I}} &=& C^{\mathcal{I}} \cap D^{\mathcal{I}} \\ (C \sqcup D)^{\mathcal{I}} &=& C^{\mathcal{I}} \cup D^{\mathcal{I}} \\ (\forall R.C)^{\mathcal{I}} &=& \{a \in \Delta^{\mathcal{I}} \mid \text{for all } b, \text{ if } \langle a,b \rangle \in R^{\mathcal{I}} \text{ then } b \in C^{\mathcal{I}} \} \\ (\exists R.C)^{\mathcal{I}} &=& \{a \in \Delta^{\mathcal{I}} \mid \text{there is a } b \text{ where } \langle a,b \rangle \in R^{\mathcal{I}} \text{ and } b \in C^{\mathcal{I}} \} \end{array}$$

### Interpretation of Axioms

- $\mathcal{I} \models C \sqsubseteq D$  if  $C^{\mathcal{I}} \subseteq D^{\mathcal{I}}$  and  $\mathcal{I} \models C \equiv D$  if  $C^{\mathcal{I}} = D^{\mathcal{I}}$
- $\mathcal{I} \models C(a)$  if  $a^{\mathcal{I}} \in C^{\mathcal{I}}$  and  $\mathcal{I} \models R(a,b)$  if  $\langle a^{\mathcal{I}}, b^{\mathcal{I}} \rangle \in R^{\mathcal{I}}$ .

NF3580 :: Spring 2010

cture 10 :: 29th Marc

Description Logi

# $\mathcal{ALC}$ Examples

- TwoCV □ Car
  - Any 2CV is a car.
- TwoCV(myCar)
  - myCar is a 2CV.
- owns(martin, myCar)
  - martin owns myCar.
- $TwoCV \sqsubseteq \forall driveAxle.FrontAxle$ 
  - All drive axles of 2CVs are front axles.
- FrontDrivenCar  $\equiv$  Car  $\sqcap \forall driveAxle.FrontAxle$ 
  - A front driven car is one where all drive axles are front axles.
- FrontAxle  $\sqcap$  RearAxle  $\sqsubseteq \bot$  (disjointness)
  - Nothing is both a front axle and a rear axle.
- FourWheelDrive  $\equiv \exists driveAxle.FrontAxle \sqcap \exists driveAxle.RearAxle$ 
  - A 4WD has at least one front drive axle and one rear drive axle.

INF3580 :: Spring 2010

Lecture 10 :: 29th March

14 / 4

#### Description Logics

### Negation

• The interpretation  $\mathcal{I}$  satisfies the axiom  $C \equiv \neg D$ :

$$\mathcal{I} \vDash C \equiv D$$

$$\Leftrightarrow C^{\mathcal{I}} = (\neg D)^{\mathcal{I}}$$

$$\Leftrightarrow C^{\mathcal{I}} = (\Delta^{\mathcal{I}} \setminus D^{\mathcal{I}})$$

• "A C is not a D."

• Example:  $EvenNo \equiv \neg OddNo$ , assuming the domain is **N**. "An even number is not an odd number."

Description Logic

# Disjointness

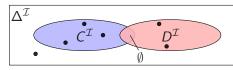

• The interpretation  $\mathcal{I}$  satisfies the axiom  $C \sqcap D \sqsubseteq \bot$ :

$$\mathcal{I} \vDash C \sqcap D \sqsubseteq \bot$$

$$\Leftrightarrow (C \sqcap D)^{\mathcal{I}} \subseteq \bot^{\mathcal{I}}$$

$$\Leftrightarrow C^{\mathcal{I}} \cap D^{\mathcal{I}} \subseteq \emptyset$$

• "Nothing is both a C and a D."

Example: FrontAxle 

RearAxle 

⊥.

RearAxle is not a RearAxle, and vice versa."

INF3580 :: Spring 2010

Lecture 10 :: 29th March

17 / 4

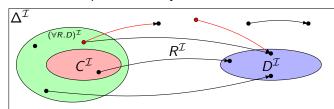

#### Description Logics

### Universal restrictions

• The interpretation  $\mathcal{I}$  satisfies the axiom  $C \sqsubseteq \forall R.D$ :

$$\begin{split} \mathcal{I} &\vDash C \sqsubseteq \forall R.D \\ &\Leftrightarrow C^{\mathcal{I}} \subseteq (\forall R.D)^{\mathcal{I}} \\ &\Leftrightarrow C^{\mathcal{I}} \subseteq \{a \in \Delta^{\mathcal{I}} \mid \text{for all } b, \text{ if } \langle a,b \rangle \in R^{\mathcal{I}} \text{ then } b \in D^{\mathcal{I}} \} \end{split}$$

• A C has R-relationships to D's only.

Example: Lotus 
 □ ∀driveAxle.RearAxle.
 "A Lotus has only rear axles as drive axles."

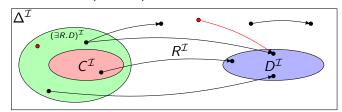

Description Logic

### Existential restrictions

• The interpretation  $\mathcal{I}$  satisfies the axiom  $C \sqsubseteq \exists R.D$ :

$$\mathcal{I} \vDash C \sqsubseteq \exists R.D \Leftrightarrow C^{\mathcal{I}} \subseteq (\exists R.D)^{\mathcal{I}} \Leftrightarrow C^{\mathcal{I}} \subseteq \{a \in \Delta^{\mathcal{I}} \mid \text{there is a } b \text{ where } \langle a, b \rangle \in R^{\mathcal{I}} \text{ and } b \in D^{\mathcal{I}} \}$$

• "A C is R-related to (at least) a D."

NF3580 :: Spring 2010

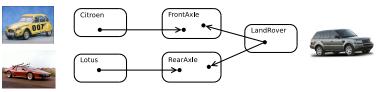

ecture 10 :: 29th March

12 / /

#### Description Logi

### Universal and Existential Restrictions cont.

- Assume:
  - All Citroen cars have one drive axle and that is the front axle.
  - All Lotus cars have one drive axle and that is the rear axle.
  - All LandRover cars have two drive axles, one front and one back.

- In such a model:
  - Citroen □ ∀driveAxle.FrontAxle
  - LandRover  $\Box \exists driveAxle.FrontAxle \Box \exists driveAxle.RearAxle$
  - Lotus  $\sqsubseteq \forall driveAxle.RearAxle$

Lecture 10 :: 29th March 19 / 41 INF3580 :: Spring 2010 Lecture 10 :: 29th March 20 / 41

# Universal Restrictions and rdfs:range

• If role R has the range C,

• then anything one can reach by R is in C, or

• for any a and b, if  $\langle a, b \rangle \in R^{\mathcal{I}}$ , then  $b \in C^{\mathcal{I}}$ , or

• any a is in the interpretation of  $\forall R.C$ , or

• the axiom  $\top \sqsubseteq \forall R.C$  holds.

• "Everything has *R*-relationships to *C*'s only."

• Ranges can be expressed with universal restrictions.

• Example:

• a drive axle is either a front or a rear axle, so

• the range of *driveAxle* is *FrontAxle*  $\sqcup$  *RearAxle*.

• Axiom:  $\top \sqsubseteq \forall driveAxle$ .(FrontAxle  $\sqcup RearAxle$ ).

# Modelling patterns

So, what can we say with ALC?

- ✓ A person has a mother.
- ✓ A penguin eats only fish. A horse eats only chocolate.
- X A nuclear family has two parents, at least two children and a dog.
- ✓ A smoker is not a non-smoker (and vice versa).
- X Everybody loves Mary.
- X Adam is not Eve (and vice versa).
- ✓ Everything is black or white.
- ✓ There is no such thing as a free lunch.
- X The brother of my father is my uncle.
- X My friend's friends are also my friends.
- X If Homer is married to Marge, then Marge is married to Homer.
- X If Homer is a parent of Bart, then Bart is a child of Homer.

### What is the score?

- We still express C(a), R(x, y),  $C \subseteq D$  like we did in RDFS,
- but now we can express complex C's and D's.
- A concept can be defined by use of other concepts and roles.
- Examples:
  - Person □ ∃hasMother. □
  - Penguin □ ∀eats.Fish
  - NonSmoker □ ¬Smoker
  - $\top \sqsubseteq BlackThing \sqcup WhiteThing$
  - FreeLunch □ ⊥

### Existential Restrictions and rdfs:domain

- If role R has the domain C.
- then anything from which one can go by R is in C, or
- for any a, if there is a b with  $\langle a,b\rangle\in R^{\mathcal{I}}$ , then  $a\in C^{\mathcal{I}}$ , or
- any a in the interpretation of  $\exists R. \top$  is in the interpretation of C, or
- the axiom  $\exists R. \top \sqsubseteq C$  holds.
- "Everything which is R-related (to a thing) is a C."
- Domains can be expressed with existential restrictions.
- Example:
  - a drive axle is something cars have, so
  - the range of driveAxle is Car.
  - Axiom:  $\exists driveAxle. \top \sqsubseteq Car.$

#### Description Logics

### Little Boxes

- Historically, description logic axioms and assertions are put in boxes.
- The TBox
  - is for terminological knowledge,
  - is independent of any actual instance data, and
  - for  $\mathcal{ALC}$ , it is a set of  $\sqsubseteq$  axioms and  $\equiv$  axioms.
  - Example TBox axioms:
    - $TwoCV \sqsubseteq \forall driveAxle.FrontAxle$
    - FrontDrivenCar  $\equiv$  Car  $\sqcap \forall driveAxle.FrontAxle.$
- The ABox
  - is for assertional knowledge,
  - contains facts about concrete instances a, b, c,
  - a set of concept membership assertions C(a),
  - and role assertions R(b, c).
  - Example ABox axioms:
    - driveAxle(myCar, axle)
    - (FrontAxle \( \subseteq \) RearAxle)(axle).

NF3580 :: Spring 2010

Lecture 10 :: 29th Marcl

25 / 4

#### Description Logics

# ABox Reasoning

- ABox consistency: Is there an model of  $(\mathcal{T}, \mathcal{A})$ , i.e., is there an interpretation  $\mathcal{I}$  such that  $\mathcal{I} \models (\mathcal{T}, \mathcal{A})$ ?
- Concept membership: Given C and a, does  $(\mathcal{T}, \mathcal{A}) \models C(a)$ ?
- ullet Retrieval: Given C, find all a such that  $(\mathcal{T},\mathcal{A})\models C(a)$ .
- Conjunctive Query Answering (SPARQL).

#### Description Logi

## TBox Reasoning

#### Remainder: Entailment

A entails B, written  $A \models B$ , if

 $\mathcal{I} \models B$  for all interpretations where  $\mathcal{I} \models A$ .

- Many reasoning tasks use only the TBox:
- Concept unsatisfiability: Given C, does  $T \models C \sqsubseteq \bot$ ?
- Concept subsumption: Given C and D, does  $\mathcal{T} \models C \sqsubseteq D$ ?
- Concept equivalence: Given C and D, does  $T \models C \equiv D$ ?
- Concept disjointness: Given C and D, does  $\mathcal{T} \models C \sqcap D \sqsubseteq \bot$ ?

INF3580 :: Spring 2010

Lecture 10 :: 29th March

26 / 4

#### D 1.11 1

## More Expressive Description Logics

- There are description logics including axioms about
  - roles, e.g., hierarchy, transitivity
  - cardinality
  - data types, e.g., numbers, strings
  - individuals
  - etc.
- We'll see more in later lectures.
- The balance of expressivity and complexity is important.
- Too much expressivity makes reasoning tasks
  - first more expensive,
  - then undecidable.
- Much research on how expressivity affects complexity/decidability.

3 Introduction to OWL

NF3580 :: Spring 2010

Lecture 10 :: 29th March

20 / 41

Introduction to OWL

## **OWL Syntaxes**

- Reminder: RDF is an abstract construction, several concrete syntaxes: RDF/XML, Turtle,...
- Same for OWI ·
- Defined as set of things that can be said about classes, properties, instances.
- DL symbols  $(\sqcap, \sqcup, \exists, \forall)$  hard to find on keyboard.
- OWL/RDF: Uses RDF to express OWL ontologies.
  - Then use any of the RDF serializations.
- OWL/XML: a non-RDF XML format.
- Functional OWL syntax: simple, used in definition.
- Manchester OWL syntax: close to DL, but text, used in some tools.

Introduction to OV

## Quick facts

#### OWL:

- Acronym for The Web Ontology Language.
- Became a W3C recommendation in 2004.
- The undisputed standard ontology language.
- Superseded by OWL 2;
  - a backwards compatible extension that adds new capabilities.
- Built on Description Logics.
- Combines DL expressiveness with RDF technology (e.g., URIs, namespaces).
- Extends RDFS with boolean operations, universal/existential restrictions and more.

NF3580 :: Spring 2010

Lecture 10 :: 29th March

30 / 4

Introduction to OWI

# OWL constructs in OWL/RDF

- New: owl:Ontology, owl:Class, owl:Thing, properties (next slide), restrictions (owl:allValuesFrom, owl:unionOf, ...), annotations (owl:versionInfo, ...).
- From RDF: rdf:type, rdf:Property, + "RDF bookkeeping".
- From RDFS: rdfs:Class, rdfs:subClassOf, rdfs:subPropertyOf, rdfs:domain, rdfs:range, rdfs:label, rdfs:comment....
- (XSD datatypes: xsd:string, ...)

3580 ·· Spring 2010 | Lecture 10 ·· 20th March 31 / 41 | INF3580 ·· Spring 2010 | Lecture 10 ·· 20th March 32 / 41

Introduction to OWI

# Properties in OWL

Three kinds of *mutually disjoint* properties in OWL:

- owl:DatatypeProperty
  - link individuals to data values, e.g., xsd:string.
  - Examples: :hasAge, :hasSurname.
- owl:ObjectProperty
  - link individuals to individuals.
  - Example: :hasFather, :driveAxle.
- owl:AnnotationProperty
  - has no logical implication, ignored by reasoners.
  - anything can be annotated.
  - use for human readable-only data.
  - Examples: rdfs:label, dc:creator.

NF3580 :: Spring 2010

Lecture 10 :: 29th March

33 / 41

#### Introduction to OWI

### Example: Universal Restrictions in Other Formats

- $TwoCV \sqsubseteq \forall driveAxle.FrontAxle$
- In OWL/XML syntax:

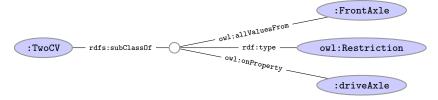

• In OWL Functional syntax:

SubClassOf(TwoCV ObjectAllValuesFrom(driveAxle FrontAxle))

#### Introduction to OWI

# Example: Universal Restrictions in OWL/RDF

•  $TwoCV \sqsubseteq \forall driveAxle.FrontAxle$ 

• In Turtle syntax:

```
:TwoCV rdfs:subClassOf [ rdf:type owl:Restriction ; owl:onProperty :driveAxle ; owl:allValuesFrom :FrontAxle ] .
```

INF3580 :: Spring 2010

ecture 10 :: 29th March

3/ //

#### Introduction to OW

# Manchester OWL Syntax

- Used in Protégé for concept descriptions.
- Also has a syntax for axioms, less used.
- Correspondence to DL constructs:

DL	Manchester
$C \sqcap D$	${\it C}$ and ${\it D}$
$C \sqcup D$	C or $D$
$\neg C$	not C
$\forall R.C$	R only $C$
$\exists R.C$	R some C

• Examples:

DL	Manchester
FrontAxle ⊔ RearAxle	FrontAxle or RearAxle
$\forall driveAxle.FrontAxle$	driveAxle only FrontAxle
$\exists drive Axle. Rear Axle$	driveAxle some RearAxle

F3580 ·· Spring 2010 Lecture 10 ·· 20th March 35 / 41 INF3580 ·· Spring 2010 Lecture 10 ·· 20th March 36

Introduction to OWL

# Demo: Using Protégé

- Create a Car class.
- Create an Axle class.
- Create FrontAxle and RearAxle as subclasses
- Make the axle classes disjoint.
- Add a driveAxle object property.
- Add domain Car and range Axle.
- Add 2CV, subclass of Car.
- Add superclass driveAxle only FrontAxle.
- Add Lotus, subclass of Car.
- Add superclass driveAxle only RearAxle.
- Add LandRover, subclass of Car.
- Add superclass driveAxle some FrontAxle.
- Add superclass driveAxle some RearAxle.
- Add 4WD as subclass of Thing.
- Make equivalent to driveAxle some RearAxle and driveAxle some FrontAxle.
- Classify.
- Show inferred class hierarchy: Car □ 4WD □ LandRover
- Tell story of 2CV Sahara, which is a 2CV with two motors, one front, one back.
- Add Sahara as subclass of 2CV
- Add 4WD as superclass of 2CV.
- Classify.
- Show that Sahara is equivalent to bottom.
- Explain why. In particular, disjointness of front and rear axles

NF3580 :: Spring 2010

Lecture 10 :: 29th Marc

37 / /

#### Introduction to OWI

### OWL in Jena

- Can use usual Jena API to build OWL/RDF ontologies.
- Cumbersome and error prone!
- Jena class OntModel provides convenience methods to create OWL/RDF ontologies, e.g.,

- Can be combined with inferencing mechanisms from lecture 7.
  - See class OntModelSpec.

#### Introduction to OWL

# The Relationship to Description Logics

- Protégé presents ontologies almost like an OO modelling tool.
- Everything can be mapped to DL axioms!
- We have seen how domain and range become ex./univ. restrictions.
- C and D disjoint:  $C \sqsubseteq \neg D$ .
- Many ways of saying the same thing in OWL, more in Protégé.
- Reasoning (e.g., Classification) maps everything to DL first.

NF3580 :: Spring 2010

ecture 10 :: 29th March

20 / 4

#### Introduction to (

### The OWL API

- OWL in Jena means OWL expressed as RDF.
- Still somewhat cumbersome, tied to OWL/RDF peculiarities.
- For pure ontology programming, consider OWL API:

http://owlapi.sourceforge.net/

- Works on the level of concept descriptions and axioms.
- Can parse and write all mentioned OWL formats, and then some.
