

Legacy System Excorsism by Pareto's Principle

Kristoffer Kvam
Kjetil Jørgensen-Dahl

Et generisk mobilnett

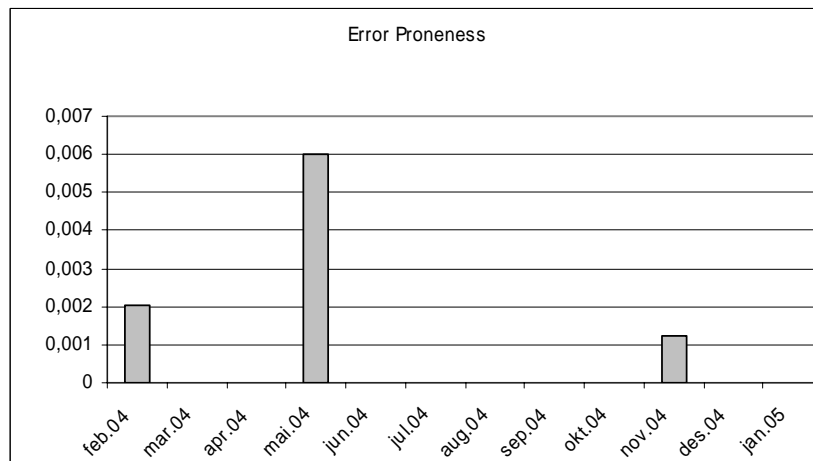

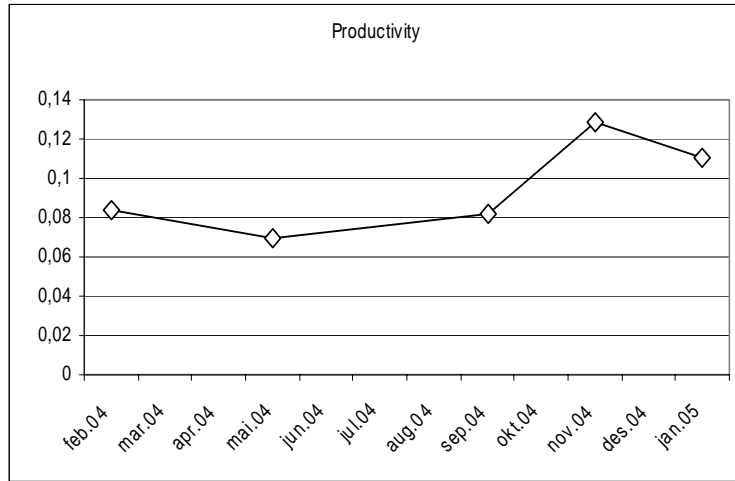

COS

- Telenor Mobile Norway's component based middleware system for:
 - Integration
 - Common Business Logic
- 350.000.000 calls a month
- Developed by 30-40 resources over the course of 8 years
- Integrates with about 30 back end systems (Ordre, Billing, Nettverksaktivering, Datavarehus, osv)

COS – Technical

- Large Java-based system
 - Weblogic application servers
 - Sybase og Oracle databases
 - Over 8.000 classes
 - 2-300 database-tables
 - 1500 services
 - 2000 stored procedures
 - Non-Generated 160K NCSS
- Integration Technology
 - Message Queues
 - Data bases
 - Web services
 - CORBA
 - Screen Scraping Cobol-systemer
 - Batch-solution
 - And more.

Agenda – Pareto Excorsism

- The Principle
- The Project
- The Results

The Pareto Principle

Vilfredo Pareto
(1848-1923)

80 / 20 Rule:
Twenty percent of the people own eighty
percent of the wealth

”The vital few and trivial many”

The Pareto Project

Business Case:

Increase the productivity in the development organization by 25% without lowering the quality.

Task:

We needed to find the 20 percent most pressing system problems that would create this effect

Measurement Program

- Productivity
= Change Requests per
(Day * Resource)
- Error Proneness
= Critical Defects per
(Day * Resource)
- Internal Quality
= 0.35 * Architectural Quality +
0.30 * Code Quality +
0.35 * Test Quality

Monitor for Quality: XRadar

- Analysis of all Java-systems
- Open source under a BSD licence
- Current Build and System History

Pareto Hypothesises I

Architecture

- 20 percent of the system functionality constitutes 80 percent of the system value

Do not rewrite

- 20 percent of the system architecture problems causes 80 percent of the observed system problems

Modularize

Pareto Hypotheses II

Code and Tests

- 20 percent of the code is given 80 percent of the maintenance
- 20 percent of the maintained code produces 80 percent of system defects

Monitor and detect bad code

Remove and deprecate code ruthlessly

Deliver an automatic Unit test framework

Deliver an automatic acceptance test framework

Introduce test first!

Pareto Hypotheses III

Culture and Process

- 20 percent of the developers' possess 80 percent of the system knowledge
- 20 percent of the formal process elements cause 80 percent process inefficiencies.

New configuration management

Interview program for new consultants

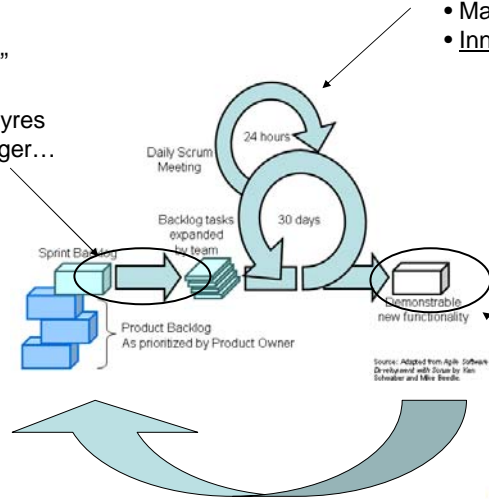

Introduce an agile iterative process (Scrum) instead of waterfall

Remove inspections and introduce pair programming

Scrum Prosesser

- Sprint Planning:**
- Alle roller deltar
 - Team "committer" seg til leveranse
 - Team kan ikke styres igjen før om 30 dager...

Daily Scrum (Standup):

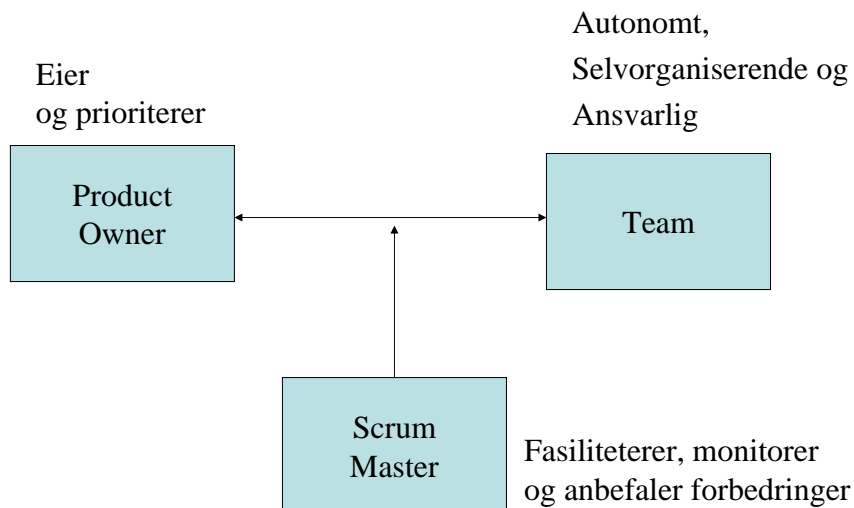

- Kun Team og Scrummaster får snakke
- Maks 15 min
- Innhold:
 - Hva har du gjort siden sist?
 - Har du hatt noen problemer
 - Hva skal du gjøre til neste møte?

Sprint review:

- Overlevering av ferdig funksjonalitet
- Evaluering og prosessforbedring

Roller

Teamdynamikk

- 5-8 medlemmer for å skape ansvarlighet, lagånd og synlige medlemmer
- Bred sammensetning for å sikre autonomitet
- Gjennomtenkt sosial/kulturell sammensetning for å sikre effektiv teamdynamikk

Nov 2002
May 2003
 - Pareto Project Initiated
 - Unit Test Framework

Nov 2003
 - New Config Man. System
 - Interview program for consultants

May 2004
 - Massive modularization and test writing
 - Knowledge share meeting

Sep 2004
 - Pareto Project ends
 - Acceptance test framework

Nov 2003
 - Test driven dev. required
 - Scrum
 - Pair Programming

Conclusion

- Massive productivity increase by:
 - Agile process (Scrum) instead of a phased plan-driven process
 - Pair development instead of formal inspections
- Reengineering to quality and cultural change was probable necessary prerequisites for the change
- Weakly : Modularization and test driven development reduced error proneness in our system

The Future

Simula Research and Telenor:

- ... will publish a paper soon on the results on the introduction of pair programming
- ... is conducting a regression analysis on internal quality and error proneness

Norwegian Computing Central (NR)

- ..is using the COS System for some groundbreaking tool support research

XRadar:

- Watch out for new cool updates SOON on:
<http://xradar.sourceforge.net>
- Get involved
