# Neuromorphic Electronics

## Introduction

# Brain Parts

## The biggest mystery

The human brain is maybe the biggest mystery left to explore.  $10^{11}$  neurons with about  $10^4$  connections to other neurons each: The combinatorial possibilities for the network connections alone are staggering. An infinite number of electrical and chemical processes going on. How to know, which ones are important for the functioning?

How does the damned thing work?

## Methods

### Two approaches to understand the nervous system

- top down, describe the black-box (psychology, AI)
- bottom up, take it apart and start with its components (Neuroanatomy, Neurophysiology)

### Conclusion

We are no way near to an understanding of the system good enough to copy it. AI does not exist.

Some subsystems of the nervous system, however, are thoroughly explored and described and in part understood.

# Neuromorphic Engineering

## A Definition of 'Understanding'

One understands something if one is able to build that thing.

Neuromorphic engineering uses the organizing principles of the nervous system to construct electronic devices. The profit is twofold:

- A better understanding of the operation of parts of the nervous system
- Efficient computational devices that are completely differently organized than computers

## Computer vs. Brain

Computer	Brain

## Computer vs. Brain

Computer	Brain
Serial	Parallel
One powerful central CPU, memory	$10^{11}$ simple distributed computational and memory units
Busses shared by several components	Dedicated local point to point connections
Not very power efficient (needs cooling)	Very power efficient (hair to keep it warm ;-)
Digital, time-discrete	Analog, continuous time
Programmed	Learning
Sensitive to errors	Robust to errors (using redundancy)

---

**Teaching** 15 lectures, lecture script (chapters handed out in lecture), selected papers

**Exercises** 4 projects (coding, I&F neuron, photocell, cochlea), workgroups with up to 2-3 students

**Tools** Matlab, solder iron, lab equipment

**Skills** electronics, maths (Dynamic Systems), programming, biology, physics, psychology

**Exam** Oral, early in December (to be discussed)
