TEK5010 Multiagent systems

Lecture 2: Agents, communication and cooperation

Exercise: Decision theory

Question 1

Consider the environment $Env = \langle E, e_0, \tau \rangle$ defined as follows:

$$E = \{e_0, e_1, e_2, e_3, e_4, e_5, e_6\}, \ \tau \ \left(e_0 \xrightarrow{\alpha_0}\right) = \{e_1, e_2, e_3\} \text{ and } \tau \ \left(e_0 \xrightarrow{\alpha_1}\right) = \{e_4, e_5, e_6\}$$

There are two agents possible with respect to this environment, which we shall refer to as Ag_1 and Ag_2 :

$$Ag_1(e_0) = \alpha_0$$
 and $Ag_2(e_0) = \alpha_1$

Assume the probabilities of the various runs are as follows:

$$P\left(e_{0} \stackrel{\alpha_{0}}{\rightarrow} e_{1} \middle| Ag_{1}, Env\right) = 0.3$$

$$P\left(e_{0} \stackrel{\alpha_{0}}{\rightarrow} e_{2} \middle| Ag_{1}, Env\right) = 0.4$$

$$P\left(e_{0} \stackrel{\alpha_{0}}{\rightarrow} e_{3} \middle| Ag_{1}, Env\right) = 0.3$$

$$P\left(e_{0} \stackrel{\alpha_{1}}{\rightarrow} e_{4} \middle| Ag_{2}, Env\right) = 0.8$$

$$P\left(e_{0} \stackrel{\alpha_{1}}{\rightarrow} e_{5} \middle| Ag_{2}, Env\right) = 0.1$$

$$P\left(e_{0} \stackrel{\alpha_{1}}{\rightarrow} e_{6} \middle| Ag_{2}, Env\right) = 0.1$$

Finally, assume the utility function *u* is defined as follows:

$$u\left(e_{0} \stackrel{\alpha_{0}}{\rightarrow} e_{1}\right) = 4$$
$$u\left(e_{0} \stackrel{\alpha_{0}}{\rightarrow} e_{2}\right) = 6$$
$$u\left(e_{0} \stackrel{\alpha_{0}}{\rightarrow} e_{3}\right) = 5$$
$$u\left(e_{0} \stackrel{\alpha_{1}}{\rightarrow} e_{4}\right) = 1$$
$$u\left(e_{0} \stackrel{\alpha_{1}}{\rightarrow} e_{5}\right) = 4$$
$$u\left(e_{0} \stackrel{\alpha_{1}}{\rightarrow} e_{6}\right) = 10$$

- a) Is this a decision-making problem or a problem of strategic interaction? Explain the variables used. What are the requirements for maximizing expected utility?
- b) Given these definitions, determine the expected utility of agent Ag_1 and Ag_2 with respect to Env and u, and explain which agent is optimal with respect to Env and u.
