## UiO Department of Technology Systems University of Oslo

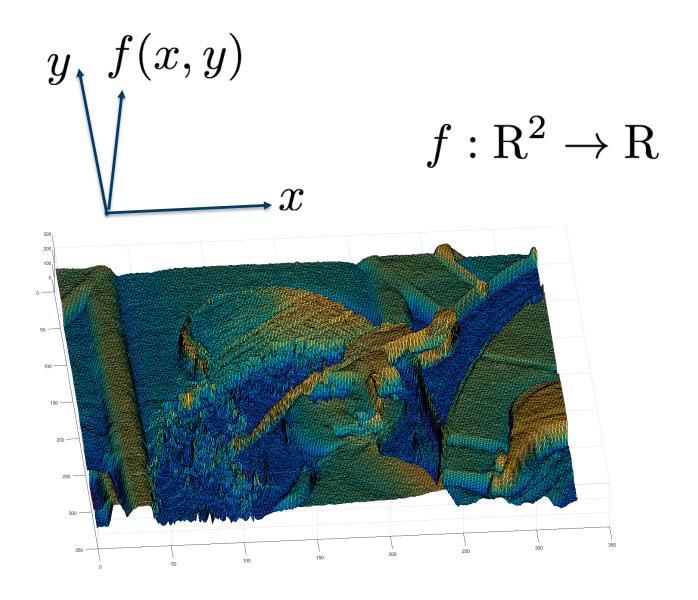

# Lecture 2.1 Image filtering

Idar Dyrdal

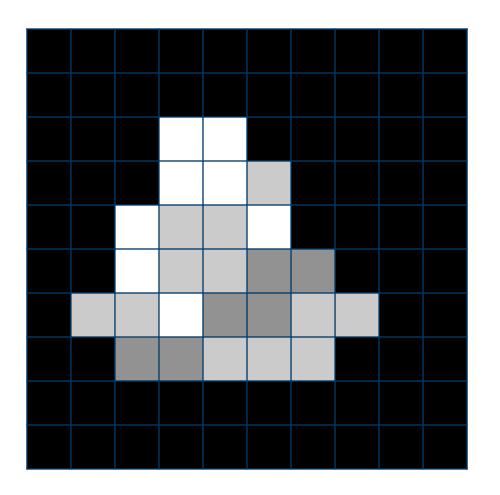

#### **Image function**

2D signal where f(x,y) gives the **intensity** at position (x,y)

#### **Digital Image**

0	0	0	0	0	0	0	0	0	0

Discrete (sampled and quantized) version of the (continuous) image function f(x,y)

#### **Image Processing**

- Point operators
- Image filtering in spatial domain
  - Linear filters
  - Non-linear filters
- Image filtering in frequency domain
  - Fourier transform

$$f[i,j] \to g[i,j]$$

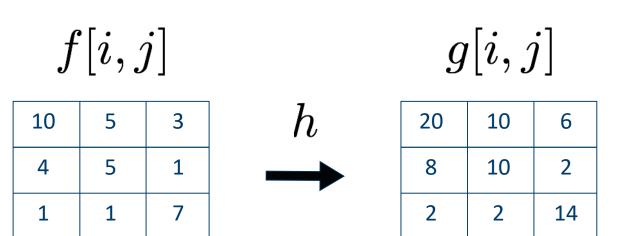

#### **Point Operators**

- Pixel transforms
  - Brightness adjustment
  - Contrast adjustment
  - **—** ...
- Colour transforms
- Histogram equalization
- ..

$$g[i,j] = h(f[i,j])$$

(Pixel-by-pixel transformation)

$$g[i,j] = 2f[i,j]$$

(Each pixel multiplied by 2)

#### **Pixel transforms - example**

Original image

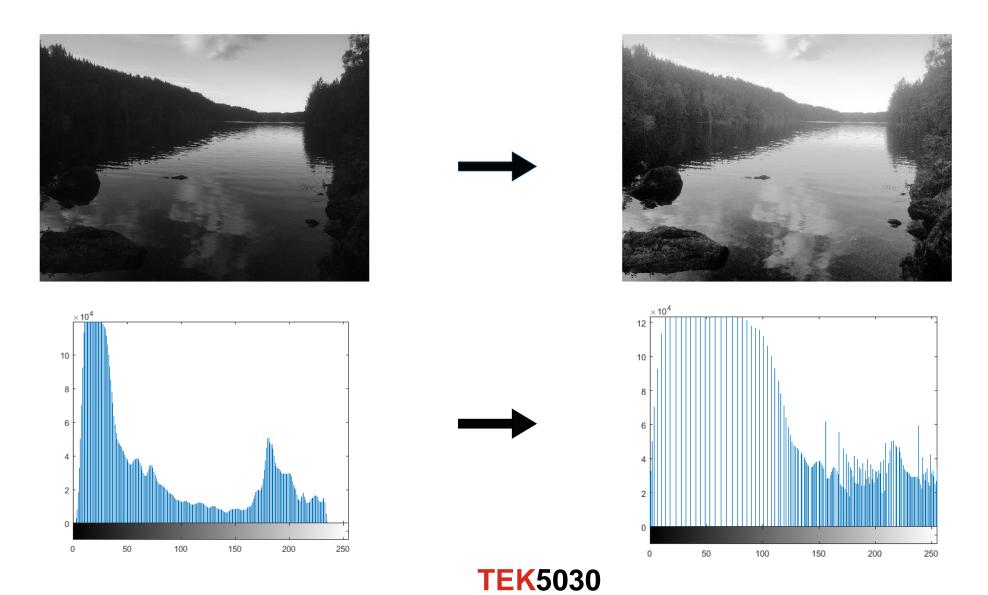

f[i,j]

#### Processed image

$$g[i,j] = \sqrt{f[i,j]}$$

## Histogram equalization

#### Image filtering

#### Image filters in the spatial domain:

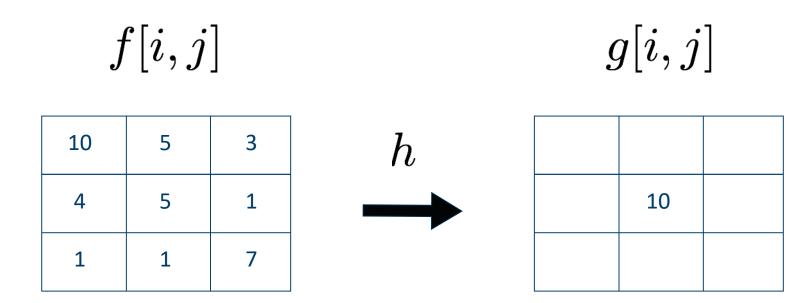

- Filtering is a mathematical operation on a grid of numbers
- Smoothing, sharpening (enhancing the image)
- Feature extraction (measuring texture, finding edges, distinctive points and patterns).

#### Image filters in the frequency domain:

- Filtering is a way to modify the (spatial) frequencies of images
- Noise removal, (re)sampling, image compression.

#### Image filtering in spatial domain

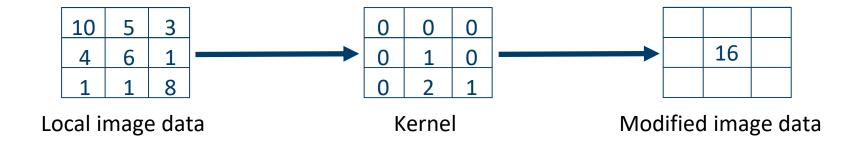

Modify the pixels in an image based on some function of a local neighborhood of each pixel:

Local image data

Modified image data

**Convolution** or **cross-correlation** where each pixel in the filtered image is a linear combination of the pixels in a local neighborhood in the original image:

The coefficients of the linear combination is contained in the "kernel" (filter mask).

#### **Cross-correlation**

Let f be the image, h be the kernel (of size  $2k+1 \times 2k+1$ ), and g be the output image:

$$g[i,j] = \sum_{u=-k}^{k} \sum_{v=-k}^{k} h[u,v]f[i+u,j+v]$$

This is called a **cross-correlation** operation:

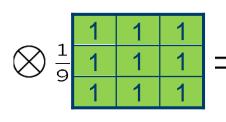

$$g = h \otimes f$$

#### Moving average filter (box filter)

3 x 3 kernel

4	1	1	1
9	1	1	1
٦	1	1	1

Replaces each pixel with an average of its neighborhood (smoothing effect)

$$g[i,j] = \sum_{u,v} h[u,v] f[i+u,j+v]$$

9 x 9 kernel

## **Sharpening filter**

Enhances differences with local average

0	0	0	1	1	1	1
0	2	0	9	1	1	1
0	0	0		1	1	1

#### Convolution

Same as cross-correlation, except that the kernel is "flipped" (horizontally and vertically):

$$g[i,j] = \sum_{u=-k}^{k} \sum_{v=-k}^{k} h[u,v]f[i-u,j-v]$$

This is called a convolution operation:

$$g = h * f$$

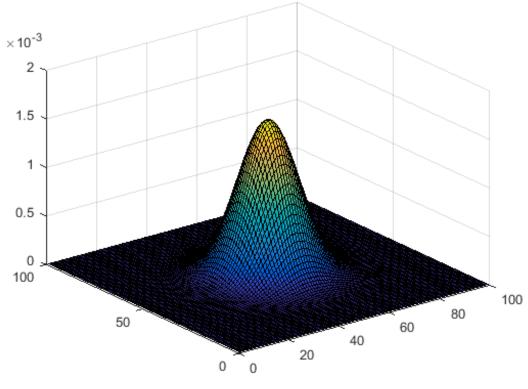

• Convolution is **commutative** and **associative** (no difference between filter and image):

$$a * b = b * a$$
  $a * (b * c) = (a * b) * c$ 

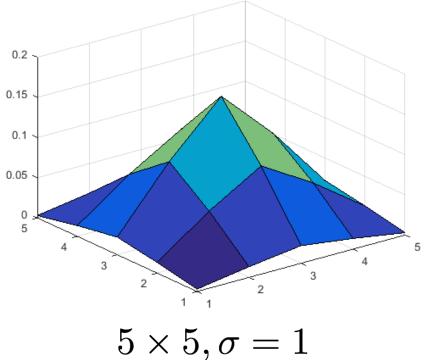

Apply several filters, one after the other:

$$(((a*b_1)*b_2)*b_3) = a*(b_1*b_2*b_3)$$

#### Gaussian filter (smoothing)

$$100 \times 100, \sigma = 10$$

$$5 \times 5, \sigma = 1$$

$$G_{\sigma} = \frac{1}{2\pi\sigma^2} e^{-\left(\frac{x^2 + y^2}{2\sigma^2}\right)}$$

18

#### **Gaussian filtering**

Original image

 $\sigma = 2$  pixels

 $\sigma = 4$  pixels

 $\sigma = 8$  pixels

#### Separable filters - example

The 2D Gaussian kernel can be expressed as a product of two 1D kernels:

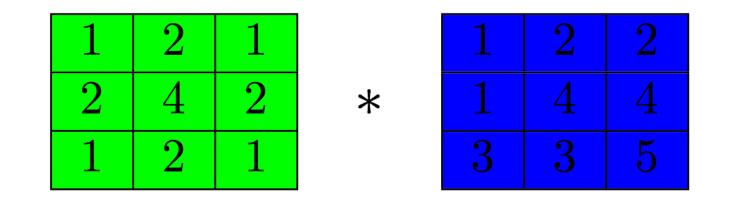

$$G_{\sigma}(x,y) = \frac{1}{2\pi\sigma^2} \exp\left(-\frac{x^2 + y^2}{2\sigma^2}\right) = \frac{1}{\sqrt{2\pi}\sigma} \exp\left(-\frac{x^2}{2\sigma^2}\right) \times \frac{1}{\sqrt{2\pi}\sigma} \exp\left(-\frac{y^2}{2\sigma^2}\right)$$

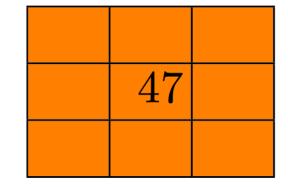

Discrete 3 x 3 approximation:

1	2	1		1				
2	4	2	=	2	×	1	2	1
1	2	1		1				

More efficient to perform two 1D convolutions compared to a single 2D convolution!

#### 2D convolution

Filter kernel

3 x 3 image window

Result (center pixel only)

#### 1D convolution along rows and columns

Convolution along rows:

Convolution along remaining column:

1		7			
2	*	13	=	47	
1		14			

## **Edge detection**

#### **Edges and image derivatives**

- An edge is a place of rapid change of the image intensity function
- Corresponds to extrema of the first derivative of the image intensity function
- Discrete approximation to the image derivatives:

$$\frac{\partial f}{\partial x}[i,j] \approx f[i+1,j] - f[i,j]$$

$$\frac{\partial f}{\partial y}[i,j] \approx f[i,j+1] - f[i,j]$$

Image gradient:

$$\nabla f = \left[ \frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right]$$

Gradient magnitude:

$$||\nabla f|| = \sqrt{\left(\frac{\partial f}{\partial x}\right)^2 + \left(\frac{\partial f}{\partial y}\right)^2}$$

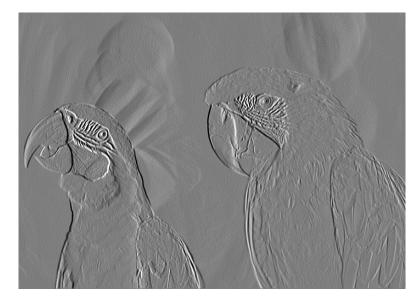

Prewitt operator:

$$G_x = egin{bmatrix} -1 & 0 & 1 \ -1 & 0 & 1 \ -1 & 0 & 1 \end{bmatrix} \quad G_y = egin{bmatrix} -1 & -1 & -1 \ 0 & 0 & 0 \ 1 & 1 & 1 \end{bmatrix}$$

## **Image gradient**

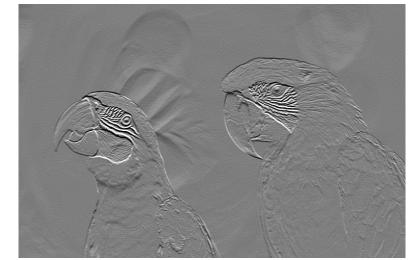

f

 $\frac{\partial f}{\partial x}$ 

 $||\nabla f||$ 

 $\frac{\partial f}{\partial y}$ 

#### **Derivative of Gaussians**

$$h_{\sigma}(u,v) = \frac{1}{2\pi\sigma^2} e^{-(\frac{u^2+v^2}{2\sigma^2})}$$

#### **Sobel operator**

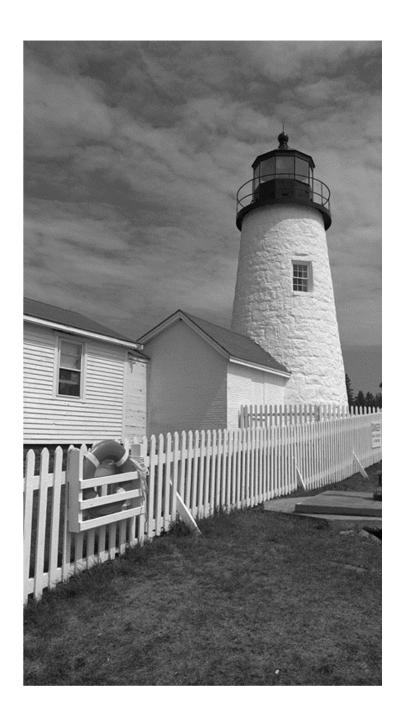

Common approximation of the derivative of a Gaussian:

-1	0	1
-2	0	2
-1	0	1

x-direction

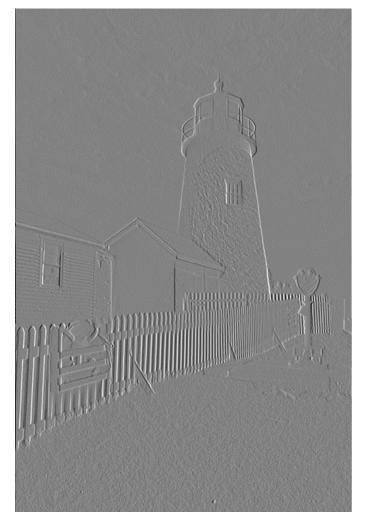

-1	-2	-1
0	0	0
1	2	1

y-direction

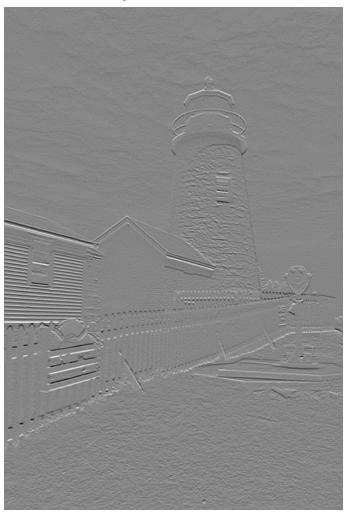

## **Sobel operator - example**

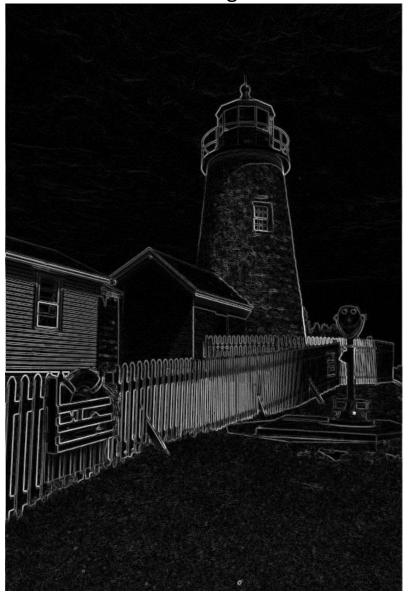

x-direction

y-direction

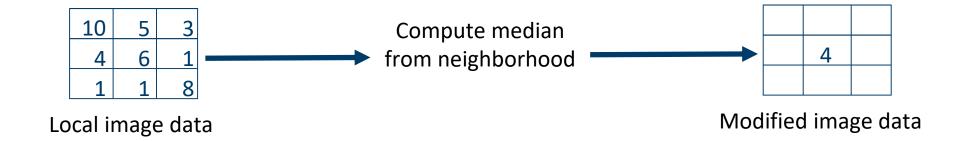

Gradient magnitude

#### Non-linear filtering - Median filter

A **median filter** operates over a neighborhood in the input image by selecting the median intensity:

#### Other non-linear filters:

- Bilateral filters (outlier rejection)
- Anisotropic diffusion
- Morphological operations (on binary images)
- ...

## Median filtering - example

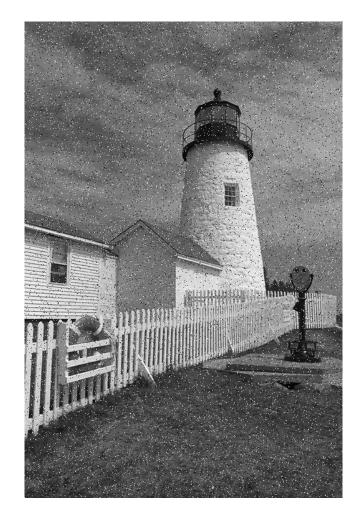

Image with Salt & Pepper noise

Image after median filtering

#### Morphological operations

- Non-linear filtering
- Typically used to clean up binary images
- Erosion: replace pixel value with minimum in local neighborhood
- Dilation: replace pixel value with maximum in local neighborhood
- Structuring element used to define the local neighborhood:

0	1	0
1	1	1
0	1	0

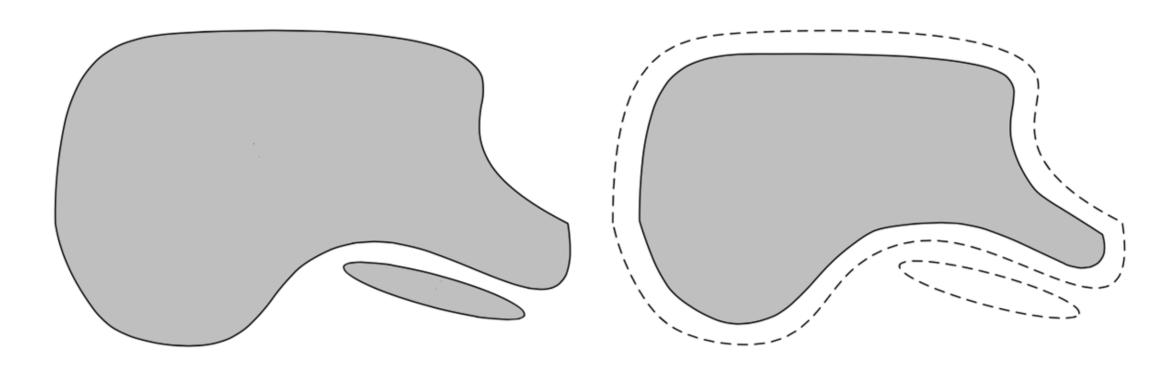

A shape (in blue) and its morphological dilation (in green) and erosion (in yellow) by a diamond-shape structuring element.

## Morphological operations - Erosion

Structuring element (disk shaped)

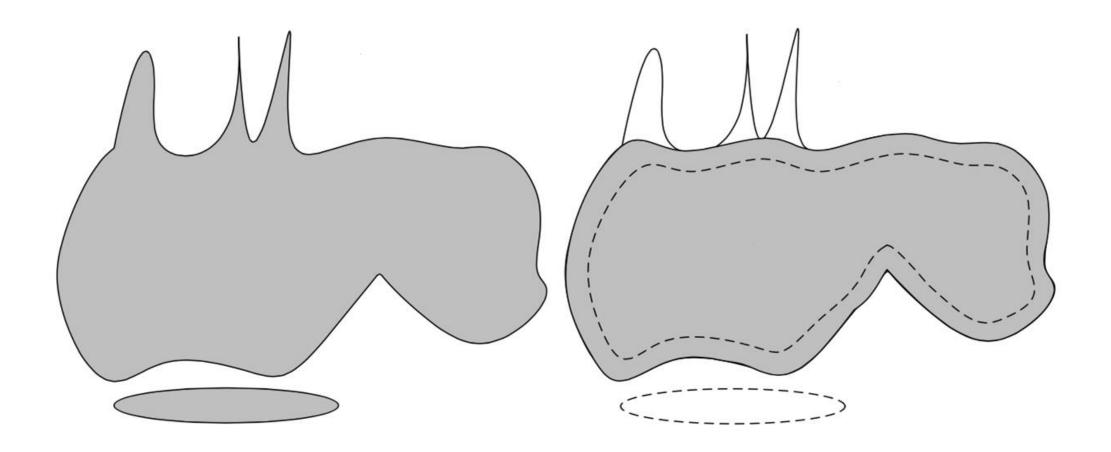

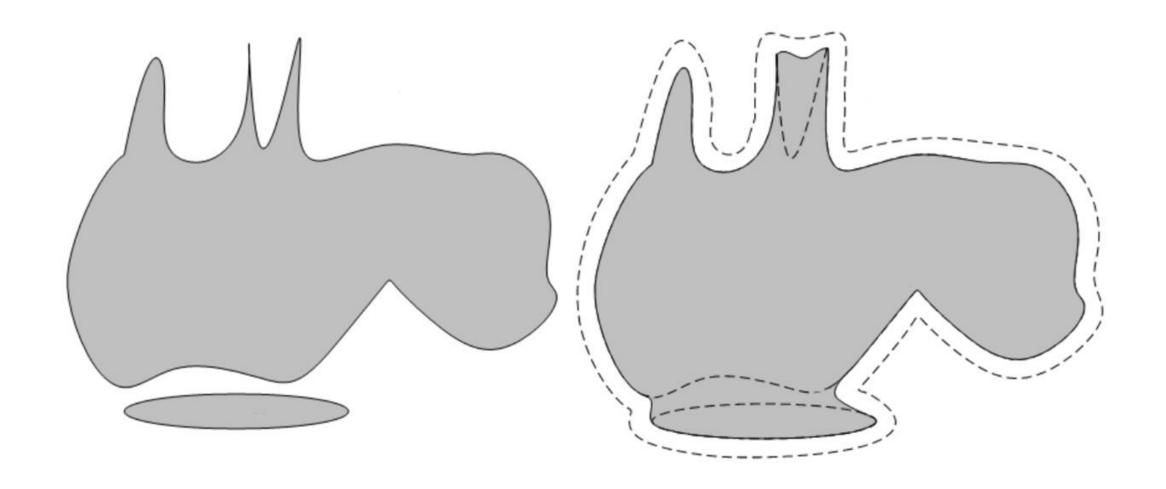

## **Morphological operations - Dilation**

Structuring element (disk shaped)

## **Opening = Erosion + Dilation**

## **Closing = Dilation + Erosion**

#### Filtering in frequency domain

#### Fourier (1807):

**Any** univariate function can be rewritten as a weighted sum of sines and cosines of different frequencies (true with some subtle restrictions).

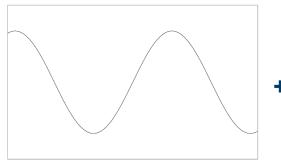

#### This leads to:

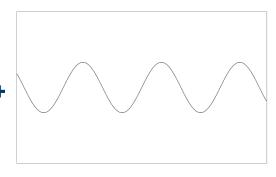

- Fourier Series
- Fourier Transform (continuous and discrete)
- Fast Fourier Transform (FFT)

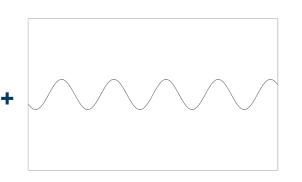

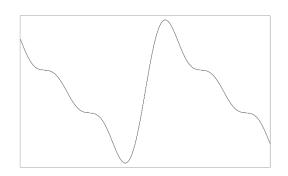

Jean Baptiste Joseph Fourier (1768-1830)

#### Sum of sines

$$A\sin(\omega x + \phi)$$

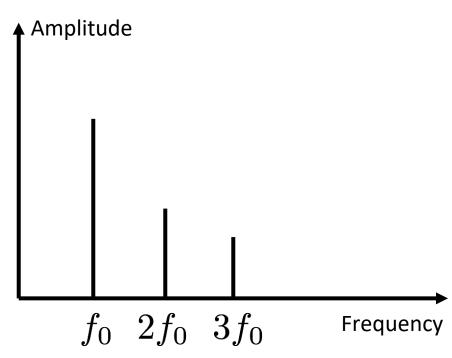

The Fourier transform stores the magnitude and phase at each frequency

Amplitude:

$$A = \pm \sqrt{R(\omega)^2 + I(\omega)^2}$$

Phase:

$$A = \pm \sqrt{R(\omega)^2 + I(\omega)^2} \qquad \phi = \tan^{-1} \frac{I(\omega)}{R(\omega)}$$

#### **Two-dimensional Fourier transform**

#### **Continous transform:**

$$F(\omega_x, \omega_y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x, y) e^{-j(\omega_x x + \omega_y y)} dx dy$$

#### Discrete transform:

F[
$$k_m,k_n$$
]  $=rac{1}{MN}\sum_{m=0}^{M-1}\sum_{n=0}^{N-1}f[m,n]e^{-2\pi jrac{(k_mm+k_nn)}{MN}}$ 

## Fourier analysis in images

Intensity images Fourier images

#### The Convolution Theorem

The Fourier transform of the convolution of two functions is the product of their Fourier transforms:

$$F[g * h] = F[g]F[h]$$

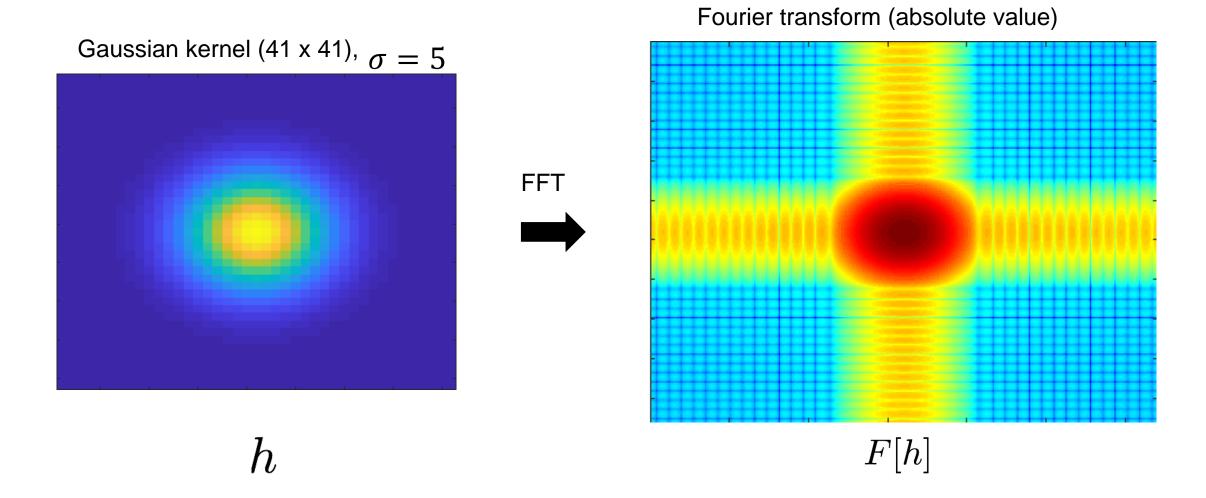

Convolution in spatial domain is equivalent to multiplication in frequency domain:

$$g * h = F^{-1}[F[g]F[h]]$$

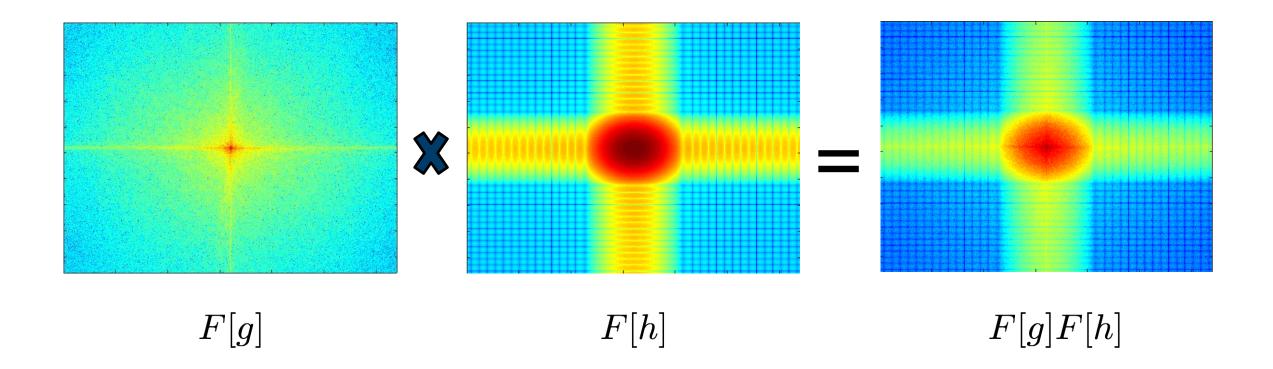

## **Example – Gaussian (low pass) filtering**

Original image Fourier transform (absolute value) FFT

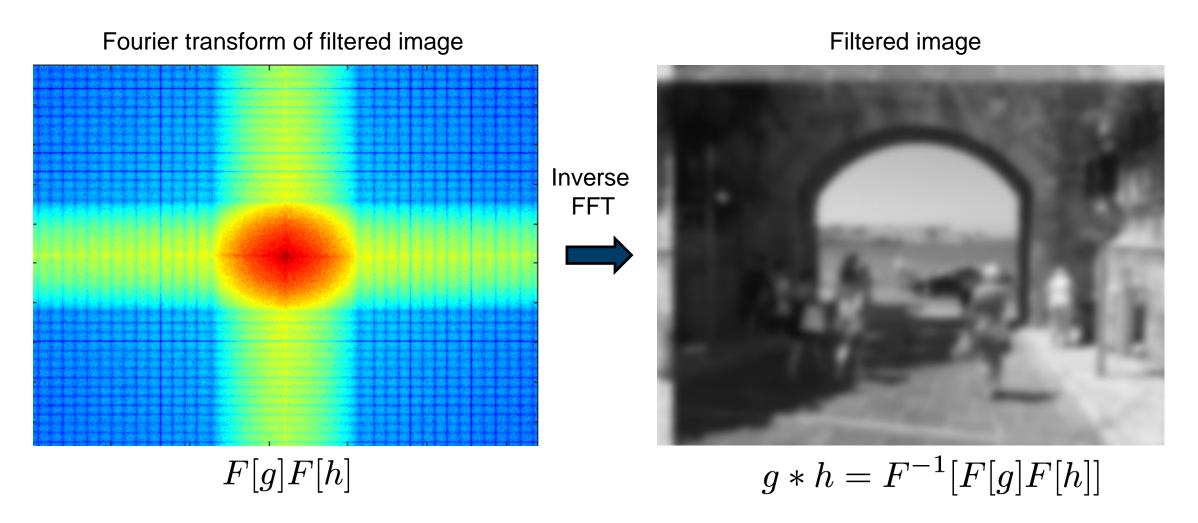

## **Example – Gaussian filtering**

## **Example – Gaussian filtering**

#### **Example – Gaussian filtering**

#### **Summary**

#### **Image Processing**

- Point operators
- Image filtering in spatial domain
  - Linear filters
  - Non-linear filters
- Image filtering in frequency domain
  - Fourier transforms
  - Gaussian (low pass) filtering

**More information:** Szeliski 3.1 – 3.4
