Task 1 (30%)

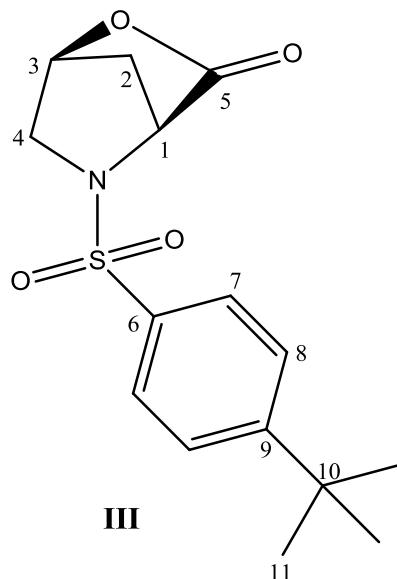

I

II

- a. The following data are given for compound I: ^1H NMR (CDCl_3 , 300 MHz): δ 1.22 (s, 3H), 1.27 (s, 3H), 1.89 (dd, $J = 7.5$ og 9.0 Hz, 1H), 2.13 (dd, $J = 3.5$ og 9.0 Hz, 1H), 2.83 (d, $J = 2.5$ Hz, 1H), 4.03 (m, 1H). Assign the signals and explain briefly the coupling pattern.
- b. Calculate λ_{max} og estimate ε_{max} for compound II. Give a very brief explanation.
- c. Identify the compound whose mass spectrum are found in attachment 1, page 2. Draw structural equations with arrows and explain briefly your reasoning.

Task 2 (30%)

Spectroscopic data for compound **III** are found in attachment 2.

- Assign the signals in the attached ^1H - and ^{13}C -NMR spectra by setting up a table with values for: Chemical shift, multiplicity (coupling), coupling constants, and number of atoms (integrals)
- Write structural equations with arrows to account for the following values in the attached mass spectrum: (EI, 70 eV): 267, 266, 265, 252, 197, 133.

Task 3 (40%).

Identify the compound whose spectroscopic data are found in attachment 3. Assign as many of the signals in the ^{13}C - and ^1H -NMR spectra as possible and give a brief explanation. Comment briefly on the given EA/MS-, IR- og UV-data.

2.10 Absorption frequencies of triple bonds and cumulated double bonds

Table 2.8 Triple bonds

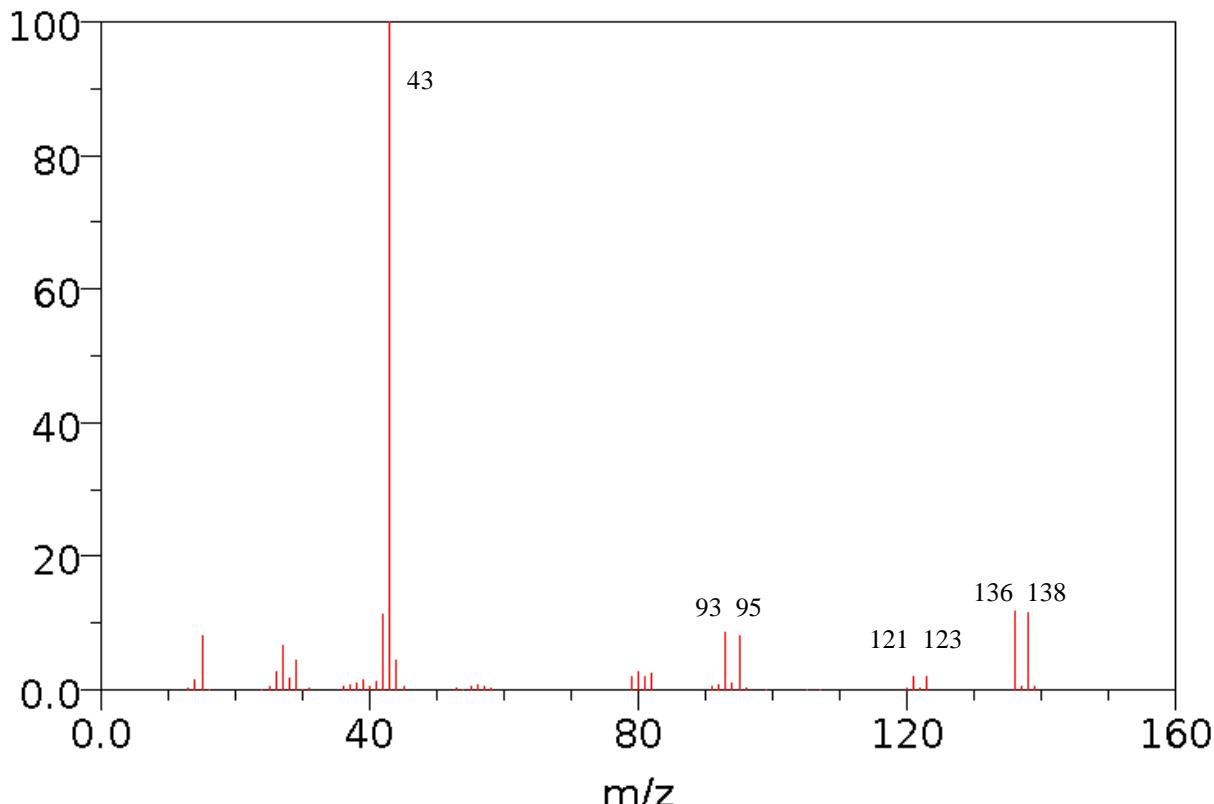

Group	Band	Remarks
$-\text{C}\equiv\text{C}-\text{H}$	3300(m) 2140–2100(w)	C—H stretching $\text{C}\equiv\text{C}$ stretching
$-\text{C}\equiv\text{C}-$	2260–2150(v)	† (See Fig. 2.9)
$-\text{C}\equiv\text{N}$	2260–2200(v)	$\text{C}\equiv\text{N}$ stretching; stronger and to the lower end of the range when conjugated; occasionally very weak (see Fig. 2.14) or absent; for example, some cyanohydrins show no $\text{C}\equiv\text{N}$ absorption
Isonitriles		
$\text{R}-\overset{+}{\text{N}}\equiv\overset{-}{\text{C}}$	2150–2110(s)	
Nitrile oxides		
$\text{RC}\equiv\overset{+}{\text{N}}-\overset{-}{\text{O}}$	2305–2280	
Diazonium salts		
$\text{R}-\overset{+}{\text{N}}\equiv\text{N}$	~2260	
Thiocyanates		
$\text{RS}-\text{C}\equiv\text{N}$	2175–2140(s)	Aryl thiocyanates at upper end of the range, alkyl at the lower end

† Conjugation with olefinic or acetylenic groups lowers the frequency and raises the intensity. Conjugation with carbonyl groups usually has little effect on the position of absorption.

Symmetrical and nearly symmetrical substitution makes the $\text{C}\equiv\text{C}$ stretching frequency inactive in the infrared. It is, however, seen clearly in the Raman spectrum.

When more than one acetylenic linkage is present, and sometimes when there is only one, there are frequently more absorption bands in this region than there are triple bonds to account for them.
