Answers to some exercises

Chapter 1

```
Section 1.5

1 a)

s1 := 0; s2 := 0;

for k := 1, 2, ..., n

if a_k > 0

s1 := s1 + a_k;

else

s2 := s2 + a_k;

s2 := -s2;
```

Note that we could also replace the statement in the **else**-branch by $s2:=s2-a_k$ and leave out the last statement.

b) We introduce two new variables pos and neg which count the number of positive and negative elements, respectively.

```
s1 := 0; pos := 0;

s2 := 0; neg := 0;

for k := 1, 2, ..., n

if a_k > 0

s1 := s1 + a_k;

pos := pos + 1;

else

s2 := s2 + a_k;

neg := neg + 1;

s2 := -s2;
```

2 We represent the three-digit numbers by their decimal numerals which are integers in the range 0–9. The numerals of the number x = 431 for example, is represented by $x_1 = 1$, $x_2 = 3$ and $x_3 = 4$. Adding two arbitrary such numbers x and y produces a sum z which can be computed by the algorithm

```
if x_1 + y_1 < 10

z_1 := x_1 + y_1;

else

x_2 := x_2 + 1;
```

```
z_1 := x_1 + y_1 - 10;
if x_2 + y_2 < 10
z_2 := x_2 + y_2;
else
x_3 := x_3 + 1;
z_2 := x_2 + y_2 - 10;
if x_3 + y_3 < 10
z_3 := x_3 + y_3;
else
z_4 := 1;
z_3 := x_3 + y_3 - 10;
```

3 We use the same representation as in the solution for exercise 2. Multiplication of two three-digit numbers *x* and *y* can then be performed by the formulas

```
\begin{aligned} product1 &:= x_1 * y1 + 10 * x_1 * y_2 + 100 * x_1 * y_3; \\ product2 &:= 10 * x_2 * y1 + 100 * x_2 * y_2 + 1000 * x_2 * y_3; \\ product3 &:= 100 * x_3 * y1 + 1000 * x_3 * y_2 + 10000 * x_3 * y_3; \\ product &:= product1 + product2 + product3; \end{aligned}
```

Section 2.3

- **5** a) Normalised number in base β: A nonzero number a is written as

$$a = \alpha \times \beta^n$$

where $\beta^{-1} \leq |\alpha| < 1$.

b) In any numeral system we have three cases to consider when defining rounding rules. Note also that it is sufficient to define rounding for two-digit fractional numbers.

In the octal numeral system the three rules are:

- 1. A number $(0.d_1d_2)_8$ is rounded to $0.d_1$ if the digit d_2 is 0, 1, 2 or 3.
- 2. If $d_1 < 7$ and d_2 is 4, 5, 6, or 7, then $(0.d_1d_2)_8$ is rounded to $0.\tilde{d}_1$ where $\tilde{d}_1 = d_1 + 1$.
- 3. A number $(0.7d_2)_8$ is rounded to 1.0 if d_2 is 4, 5, 6, or 7.
- c) No answer given.
- 6 One possible program:

```
n := 1;

while 1.0 + 2^{-n} > 1.0

n := n + 1;

print n;
```

Section 6.1

1 In simpler English the riddle says: Diophantus' youth lasted 1/6 of his life. He had the first beard in the next 1/12 of his life. At the end of the following 1/7 of his life Diophantus got married. Five years laster his son was born. His son lived exactly 1/2 of Diophantus' life. Diophantus died 4 years after the death of his son. Solution: If d and s are the ages of Diophantus and his son when they died, then the epitaph corresponds to the two equations

$$d = (1/6 + 1/12 + 1/7)d + 5 + s + 4,$$

$$s = 1/2d.$$

If we solve these we obtain s = 42 years and d = 84 years.

Section 6.2

- **a)** $x_2 = 2, x_3 = 5, x_4 = 13, x_5 = 34$
 - **b)** $x_2 = 17, x_3 = 32, x_4 = 83, x_5 = 179$

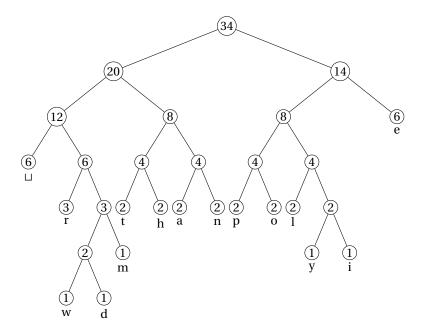

Figure 16. The Huffman tree for the text 'there are many people in the world'.

Section 7.1

1 No answers given.

Section 7.2

1 Huffman coding of the text "There are many peopole in the world". (In this soultion we will treat the capital t in "There" as if it were not capitalized.)

a)
$$f(t) = 2, \qquad f(a) = 2, \qquad f(o) = 2, \\ f(h) = 2, \qquad f(m) = 1, \qquad f(l) = 2, \\ f(e) = 6, \qquad f(n) = 2, \qquad f(i) = 1, \\ f(r) = 3, \qquad f(y) = 1, \qquad f(w) = 1, \\ f(\sqcup) = 6, \qquad f(p) = 2, \qquad f(d) = 1.$$

b) An example of a Huffman tree for this text can be seen in figure 16:

c) The Huffman coding for the text "there are many people in the world" is then:

0100 0101 11 0010 11 000 0110 0010 11 000

$00111\ 0110\ 0111\ 10110\ 000\ 1000\ 11\ 1001\ 1000$ $1010\ 11\ 000\ 10111\ 0111\ 000\ 0100\ 0101\ 11\ 000$

001100 1001 0010 1010 001101

The entropy is:

$$H = 3.6325$$
 (.6)

which means an optimal coding of the text would use 3.6325 bits per symbol. There are 34 symbols so the minimum coding would consist of 15 bytes and 4 bits. The Huffman coding above gave 15 bytes and 5 bits of information, so this coding is very good.

- 2 a) Use ternary trees instead of binary ones. (Each tree has either zero or three subtrees/children).
 - **b)** Use n-nary trees. (Each tree has either zero or n subtrees/children)
- 3 a)

$$f(A) = 4$$
,

$$f(B) = 2$$
,

$$f(C) = 2$$
,

One of the four possible Huffman codings are:

0 10 0 11 0 10 11 0

The entropy is

$$H = 1.5 \tag{.7}$$

This gives an optimal coding with 12 bits for 8 symbols, which is just what the Huffman coding gave.

- **b)** Dividing all the frequensies by 2 and interchanging A with C in the four trees in *a*) gives the four trees for this problem. The four sets of codes are the same (with A interchanged by C) and so is the entropy so the situation is still optimal.
- 4 Frequensies used are all 1.

Section 7.3

- 1 $\log_2 x = \ln x / \ln 2$.
- 2 No answers given.
- 3 No answers given.

Section 7.4

1 a)

$$f(A) = 9,$$
 $p(A) = 0.1,$
 $f(B) = 1,$ $p(B) = 0.9,$

- **b**) 5 bits
- **c)** 01110
- **a)** H = 2

 - **b)** 2 bits per symbol **c)** 2m + 1 bits $\frac{2m+1}{m} \approx 2$ bits per symbol
 - d)

00 10 11 01 00 10

e)

00 10 11 01 00 10 1

4

 $01\ 01\ 11\ 10\ 00$

5

$$f(x) = c + (y - a)\frac{d - c}{b - a}$$

$$\tag{.8}$$

Section 7.6

1 No answer given.

Section 9.1

- 1 No answer given.
- **2 a)** $T_2(x;1) = 1 3x + 3x^2$.
 - **b)** $T_2(x;0) = 12x^2 + 3x + 1.$
 - c) $T_2(x;0) = 1 + x \ln 2 + (\ln 2)^2 x^2 / 2$.
- 3 No answer given.
- 4 No answer given.

Section 9.2

1 a)

$$p_3(x) = -\frac{(x-1)(x-3)(x-4)}{12} - \frac{x(x-1)(x-4)}{3} + \frac{x(x-1)(x-3)}{12}.$$

- b) No answer given.
- c)

$$p_3(x) = 1 - x + \frac{2}{3}x(x-1) - \frac{1}{3}x(x-1)(x-3).$$

Section 9.3

- 1 a) f[0,1,2,3] = 0.
 - b) No answer given.
- **a)** The Newton form is

$$p_2(x) = 2 - x$$
.

- b) No answer given.
- **a)** Linear interpolant p_1 :

$$p_1(x) = y_1 + (y_2 - y_1)(x - 1).$$

Error at *x*:

$$f[1,2,x](x-1)(x-2) = \frac{f''(\xi)}{2}(x-1)(x-2)$$

where ξ is a number in the smallest interval (a, b) that contains all of 1, 2, and x.

Error at x = 3/2:

$$\frac{f''(\xi_1)}{8}$$

where ξ is a number in the interval (1,2).

b) Cubic interpolant:

$$p_3(x) = y_0 + (y_1 - y_0)x + \frac{y_2 - 2y_1 + y_0}{2}x(x-1) + \frac{y_3 - 3y_2 + 3y_1 - y_0}{6}x(x-1)(x-2).$$

Error:

$$f[0,1,2,3,x]x(x-1)(x-2)(x-3) = \frac{f^{(i\nu)}(\xi)}{4!}x(x-1)(x-2)(x-3)$$

where ξ is now a number in the smallest open interval that contains all of 0, 1, 2, 3, and x. With x = 3/2 this becomes

$$\frac{3}{128}f^{(iv)}(\xi_3)$$

where ξ_3 is a number in the interval (0,3).

Section 9.4

1 No answer given.

Section 10.2

- **a)** Approximation after 10 steps: 0.73876953125.
 - **b**) To get 10 correct digits it is common to demand that the relative error is smaller than 5×10^{-11} , even though this does not always ensure that we have 10 correct digits. A challenge with the relative error is that it requires us to know the exact zero. In our case we have a very good approximation that we could use, but as we commented when we discussed properties of the relative error, it is sufficient to use a rough estimate, like 0.7 in this case. The required inequality is therefore

$$\frac{1}{2^N 0.7} \le 5 \times 10^{-11}.$$

This inequality can be easily solved and leads to $N \ge 35$.

- c) Actual error: 1.3×10^{-11}
- d) No answer given.
- 2 No answers given.
- 3 No answers given.
- 4 No answers given.

Section 10.3

- - **b)** $f(x) = x^{12} 2$.
 - **c)** $f(x) = \ln x 1$.
- 2 No answer given.
- 3 No answers given.

Section 10.4

- 1 If you do the computations with 64-bit floating-point numbers, you have full machine accuracy after just 4 iterations. If you do 7 iterations you actually have about 164 correct digits.
- **a)** Midpoint after 10 iterations: 3.1416015625.
 - **b)** Approximation after 4 iterations: 3.14159265358979.
 - c) Approximation after 4 iterations: 3.14159265358979.
 - d) No answer given.
- 3 No answer given.
- 4 a) No answer given.
 - **b)** $e_{n+1} = e_{n-1}e_n/(x_{n-1} + x_n)$, where $e_n = \sqrt{2} x_n$.
- 5 a) No answer given
 - **b)** After 5 iterations we have the approximation 0.142857142857143 in which all the digits are correct (the fourth approximation has approximate error 6×10^{-10}).
- 6 a) No answer given
 - b) No answer given
 - c) An example where $x_n > c$ for n > 0 is $f(x) = x^2 2$ with $c = \sqrt{2}$ (choose for example $x_0 = 1$). If we use the same equation, but choose $x_0 = -1$, we converge to $-\sqrt{2}$ and have $x_n < c$ for large n (in fact n > 0).

An example where the iterations jump around is in computing an approximation to a zero of $f(x) = \sin x$, for example with $x_0 = 4$ (convergence to $c = \pi$).

Section 14.4

1 If the step length is h, we obtain the approximation

$$x(h) \approx x(0) + hf(t, x) = 1 + h\sin h.$$

The error is given by

$$R_1(h) = \frac{h^2}{2} x''(\xi)$$

where $\xi \in (0, h)$. Since $x'(t) = \sin x(t)$, we have

$$x''(t) = x'(t)\cos x(t) = \sin x(t)\cos x(t) = \frac{\sin(2x(t))}{2}$$

We therefore have $|x''(t)| \le 1/2$, so

$$\left|R_1(h)\right| \le \frac{h^2}{4}.$$

Section 14.5

- 1 a) x''(0) = 1, x'''(0) = 1.
 - **b)** x''(0) = 1, x'''(0) = 0.
 - **c)** x''(1) = 0, x'''(0) = 0.
 - **d)** x''(1) = 0, x'''(1) = 0.

Section 14.6

- 1 **a)** Euler: $x(1) \approx 5.01563$. Quadratic Taylor: $x(t) \approx 5.05469$. Quartic Taylor: $x(t) \approx 5.14583$.
 - **b)** Euler: $x(1) \approx 2.5$. Quadratic Taylor: $x(t) \approx 3.28125$. Quartic Taylor: $x(t) \approx 3.43469$.
 - c) Euler: $x(1) \approx 12.6366$. Quadratic Taylor: $x(t) \approx 13.7823$. Quartic Taylor: $x(t) \approx 13.7102$.
- **2 a)** Euler: $x(0.5) \approx 1.5$. Since we only take one step, Euler's method is just the approximation

$$x(h)\approx x(0)+hx'(0)$$

where h = 0.5, x(0) = 1, and $x'(t) = e^{-t^2}$. The error is therefore given by the remainder in Taylor's formula

$$R_1(h) = \frac{h^2}{2} x''(\xi_1),$$

where $\xi_1 \in (0, h)$. Since the right-hand side

$$g(t) = e^{-t^2}$$

of the differential equation is independent of x, we simply have

$$x''(t) = \frac{d}{dt}(x'(t)) = \frac{d}{dt}(g(t)) = \frac{d}{dt}(e^{-t^2}) = -2te^{-t^2}.$$

To bound the absolute error $|R_1(h)|$, we therefore need to bound the absolute value of this expression. A simple upper bound is obtained by using the estimates $|t| \le 0.5$ and $e^{-t^2} \le 1$,

$$|R_1(0.5)| \le \frac{0.5^2}{2} \cdot 0.5 = \frac{1}{16} = 0.0625.$$

The actual error turns out to be about 0.039.

b) Quadratic Taylor: $x(0.5) \approx 1.5$.

In this case we need to estimate $R_2(0.5)$, where

$$R_2(h) = \frac{h^3}{6} x'''(\xi_2)$$

and $\xi_2 \in (0,h)$. We have $x'''(t) = g''(t) = 2(2t^2 - 1)e^{-t^2}$. The maximum of the first factor is 2 on the interval [0,0.5] and the maximum of the second factor is 1. We therefore have

$$|R_2(0.5)| \le 2\frac{0.5^3}{6} \approx 0.042.$$

c) Cubic Taylor: $x(0.5) \approx 1.458333$. In this case the remainder is

$$R_3(h) = \frac{h^4}{24} x''''(\xi_3),$$

where $\xi_3 \in (0,h)$ and $x''''(t) = g'''(t) = 4t(3-2t^2)e^{-t^2}$. The quick estimate is

$$4t \le 2$$
, $3-2t^2 \le 3$, $e^{-t^2} \le 1$

which leads to

$$|R_3(0.5)| \le \frac{0.5^4}{24} \times 3 \times 2 = \frac{0.5^4}{4} \approx 0.016.$$

The true error is approximately 0.0029.

We can improve the estimate slightly by finding the maximum of g'''(t). On the interval [0,0.5] this is an increasing function so its maximum is $g'''(0.5) \approx 3.89 \le 4$. This leads to the slightly better estimate

$$\left| R_3(0.5) \right| \le \frac{0.5^4}{24} 4 \approx 0.010.$$

3 No answer given.

- **4 a)** $x''(t) = 2t + 3x^2x' x'$.
 - **b)** Quadratic Taylor with 1 step: $x(2) \approx 1$. Quadratic Taylor with 2 steps: $x(2) \approx 4$. Quadratic Taylor with 5 steps: $x(2) \approx 28651.2$.
 - c) Quadratic Taylor with 10 steps: $x(2) \approx 6 \times 10^{122}$. Quadratic Taylor with 100 or 1000 steps leads to overflow.
- **a)** No solution given.
 - **b)** $x'''(t) = 2 + 6xx'^2 + 3x^2x'' x''$. One time step: $x(2) \approx 3.66667$. Two time steps: $x(2) \approx 22.4696$.
 - c) No solution given.
 - **d)** 10 time steps: $x(2) \approx 1.5 \times 10^{938}$ (overflow with 64 bit numbers). 100 time steps: overflow. 1000 time steps: overflow.

Section 14.9

a) We set $x_1 = y$, $x_2 = y'$, $x_3 = x$, and $x_4 = x'$. This gives the system

$$x_1'=x_2,$$

$$x'_1 - x_2,$$

 $x'_2 = x_1^2 - x_3 + e^t,$
 $x'_3 = x_4,$
 $x'_4 = x_1 - x_3^2 - e^t.$

$$x_3' = x_4$$

$$x_4' = x_1 - x_3^2 - e^t$$

b) We set $x_1 = x$, $x_2 = x'$, $x_3 = y$, and $x_4 = y'$. This gives the system

$$x_1'=x_2,$$

$$x_2' = 2x_3 - 4t^2x_1,$$

$$x_3'=x_4,$$

$$x_4' = -2x_1 - 2tx_2.$$
