

**ECON4140 Mathematics 3**

June 1st 2018, 1430–1730.

There are 2 pages of problems to be solved.

All printed and written material may be used, as well as both the approved calculators.

Grades given run from A (best) to E for passes, and F for fail.

- You are required to state reasons for all your answers.
- You are permitted to use any information stated in an earlier letter-enumerated item (e.g. “(a)”) to solve a later one (e.g. “(c)”), regardless of whether you managed to answer the former. A later item does not necessarily require answers from or information given in a previous one.

**Problem 1** Let  $\mathbf{A}_c = \begin{pmatrix} 0 & 0 & 9 \\ 0 & c & 0 \\ 5 & 0 & 4 \end{pmatrix}$  for each real constant  $c$ .

- (a) Decide the rank of  $\mathbf{A}_c$  and the definiteness of the quadratic form  $Q(\mathbf{x}) = \mathbf{x}'\mathbf{A}_c\mathbf{x}$ .
- (b)  $\mathbf{v} = (9, 0, -5)'$  is an eigenvector. Find the associated eigenvalue  $\nu < 0$ .
- (c) Calculate the characteristic polynomial  $p(\lambda)$  and show that  $p(c) = 0$ .
- (d) Find an eigenvalue  $\mu > \nu$  such that  $\mu$  does not depend on  $c$ , and an associated eigenvector  $\mathbf{u}$ .

**Problem 2** Consider the difference equation  $x_{t+2} - x_{t+1} + x_t = \kappa 2^t$ .

- (a) In this part, let  $\kappa = 0$ . Find the particular solution that satisfies  $x_0 = 0$  and  $x_1 = 1$ .
- (b) In this part, let  $\kappa = 1$ . Find the general solution.
- (c) Let  $a_n = \frac{1}{n! \cdot (n+2)}$ . Prove by induction that  $a_1 + \dots + a_n = \frac{1}{2} - \frac{1}{(n+2)!}$ .

**Problem 3** Let  $a \geq b$  be constants, either both  $> 1$  or both  $\in (-1, 1)$  (i.e., either  $a \geq b > 1$  or  $1 > a \geq b > -1$ ). Consider the differential equation system

$$\begin{aligned} \dot{x} &= (1 - ay - x) \cdot x \\ \dot{y} &= (1 - bx - y) \cdot y \end{aligned} \tag{S}$$

- (a)
  - Find all four stationary states (equilibrium points).
  - Classify that stationary state  $(\bar{x}, \bar{y})$  for which both  $\bar{x} > 0$  and  $\bar{y} > 0$ . (Such a point does exist under the assumptions on the constants. Your answer might depend on  $a$  and  $b$ .)
- (b) Let  $a = b = \frac{1}{2}$ . Sketch a phase diagram covering the set where  $0 \leq x \leq 2$ ,  $0 \leq y \leq 2$ , and indicate some solution curves.

**Problem 4** Consider for constants  $x_0 > 0$  and  $T > 0$  the optimal control problem

$$\max_{u(t) \in [0,1]} \int_0^T (u - x^2) dt \quad \text{where } \dot{x} = x + u, \quad x(0) = x_0 \quad \text{and } x(T) \text{ free.}$$

- (a) State the conditions from the maximum principle. Are these conditions also sufficient?
- (b) Show that an optimal control  $u^*$  must be 0 or 1 somewhere in the open interval  $(0, T)$ . (I.e., that it *cannot* be optimal to choose a  $u$  s.t.  $u(t) \in (0, 1)$  for all  $t \in (0, T)$ .)

**Problem 5** Define the functions  $u$  and  $v$  on the (convex!) set  $\{(x, y); x \geq 0, y \geq 0\}$  by

$$u(x, y) = (16xy)^3 \quad \text{and} \quad v(x, y) = x + \sqrt{x^2 + 2y}$$

- (a) Decide quasiconcavity/quasiconvexity of each of the functions  $u$  and  $v$ .  
*Hints:* (I) “neither” is wrong answer! (II) solve level curves  $v(x, y) = C$  for  $y$ .

Consider now the *necessary* Kuhn-Tucker conditions – *disregarding* constraint qualifications, which you can take for granted that hold – associated to each of the problems

$$\begin{aligned} \max u(x, y) \quad \text{such that} \quad & v(x, y) = 1, \quad x \geq 0, \quad y \geq 0 & \text{(P1)} \\ \max (-v(x, y)) \quad \text{such that} \quad & u(x, y) \geq 1, \quad x \geq 0, \quad y \geq 0 & \text{(P2)} \end{aligned}$$

It is a fact that  $(x_1, y_1) = (\frac{1}{2}, 0)$  satisfies the necessary conditions associated to (P1), and that  $(x_2, y_2) = (\frac{1}{4}, \frac{1}{4})$  satisfies the necessary conditions associated to (P2).

- (b) For each problem (P1), resp. (P2), and the corresponding point  $(x_1, y_1)$ , resp.  $(x_2, y_2)$ : Does the point  $(x_1, y_1)$  resp.  $(x_2, y_2)$  also satisfy *sufficient* Kuhn–Tucker conditions? If not: which part of the conditions fails?

*Hint:* The Lagrangians are *not* concave.
